1. Business-Information Crosswalk

The VA Information Exchange Matrix (IEM) provides the business-information crosswalk. This compound model serves as a link between the VA business architecture and the VA data architecture. It shows the flow of business information between sending and receiving processes and provides a mapping of VA data classes in the Corporate Information Model to VA processes and their implementing projects. This mapping answers the Data Reference Model (DRM) question of what VA services are available to access data within the VA community of interest.
