Women's Health Program Relocated for Better Quality Care for Our Veterans

By Nickola L. Rogers, M.D.

Director Women's Health Program
Southern Arizona VA Health Care System

The Women's Veteran Health Program (WVHP), is pleased to announce the relocation of our Primary Care and Gynecology Clinics to the new Ambulatory Care Addition (ACA), at the Southern Arizona VA Health Care System (SAVAHCS). Clinics are now held in Building 80 on the first floor of the new ACA. This expansion includes a separate reception room, exam rooms, and a treatment room for "Women Only." The mission of the Women's Veteran Health Program is to specifically address the health care needs of eligible women veterans, providing appropriate, timely and compassionate health care at SAVAHCS.

Medical services offered at SAVAHCS include: primary care, preventive health screening for breast and cervical cancer, gender specific care, reproductive health care (including maternity care and infertility evaluation), osteoporosis, menopause, and general gynecology. A treatment room allows office procedures to be performed in the office setting. Surgical services include general gynecology, urology, and oncology. Mental health services available include: sexual trauma counseling, substance abuse

treatment, evaluation and treatment of Post Traumatic Stress Disorder, (PTSD), and depression. New programs offered at the WVHP include: chronic pain management, and non-surgical approaches to bladder disorders.

The WVHP is actively involved in training, including: physician residents, nurse practitioner students, and other VA personnel updating or learning – gynecologic exam skills, women's primary care, pelvic exams, pap smears, breast exam techniques, bladder scanning, and other related knowledge bases.

The WVHP programs are constantly monitored and updated to improve service to our women veterans. Our women's health team includes: nurse practitioners, an internist, two OB/gynecologists, a psychologist, registered nurses, clerks, and other services such as social work, dietitian consults, and pharmacology at SAVAHCS. The blood draw station, radiology, and pharmacy are located close to the Women's Health Clinic to better serve you.

We look forward to seeing you! Make your appointment by calling **(520) 792-1450, option 4**, or call the Women Veteran's Coordinator, Barbara Palmer, RN, MS, ANP at **(520) 792-1450, extension 5498** for further information.

Women's Health Program Staff: Left to right - Jim Day, Clerk; Mary Valenzuela, LPN; Barbara Palmer, ANP, WVC; Jacinda Berg, RN; Nickola Rogers, MD, MPH; Sonia Perez-Padilla, MD; Elaine Hooper, ANP; Lori Rice, NP Student

Beware of Secret Diet Killers

Psssssst! Have you heard? Secret Diet Killers are waiting to sabotage your weight loss efforts. Here are just a few of them:

1. MAKING FAVORITE FOODS FORBIDDEN

Weight loss does not mean deprivation. If you love pizza, eat it once a month instead of once a week. Eat two pieces instead of four. Denying yourself pleasure will lead to failure.

2. OVEREATING DIET FOOD

Switching to low-fat or low-calorie foods is smart, but remember to eat sensibly. Consuming an entire bag of reduced fat cookies will not help you achieve your goal.

3. FORGETTING LITTLE BITES

If you're tracking food intake, don't forget little nibbles and "tastes" of cookie batter, spaghetti sauce, and homemade salad dressing. Every bite contains fat or calories, so every bite counts!

4. AIMING FOR ZERO

Dieters often try to reduce calories as much as possible. While you may need to decrease caloric intake, don't attempt to avoid *all* calories. The human body *requires* a certain amount of fat and sugar. Ask your doctor how many calories you need each day and plan meals accordingly.

5. OBSESSING ABOUT THE SCALES

On a sensible weight loss plan, you may only lose one or two pounds each week. Daily weights fluctuate, so don't climb on the scales each morning to measure your progress. Seeing the dial move up even one pound can be disappointing enough to cause some people to give up.

6. SWEARING OFF SOLIDS

Never, ever go on a so-called liquid diet or consume diet drinks in lieu of solid food. Your body is not able to function properly without a variety of vitamins and minerals, and the best way to get them is through healthy meals.

Be on the lookout for these and other Diet Killers. Your ability to recognize them puts you a step closer to achieving your goals.

Most Lower Back Pain is Avoidable

People who suffer from lower back pain have something in common with their physician: frustration! Why is treating such a common malady so difficult?

Most back pain is caused by weak muscles, excess weight, lack of exercise, or poor posture. Muscle spasms in the back cause pain, and the prolonged pain induces additional spasms. The cycle continues - sometimes for weeks - and occasionally extends into the buttocks, upper legs, and hips. But doctors who can't find any actual nerve damage can only suggest rest or lifestyle changes, and perhaps prescribe pain medication.

Back pain sufferers usually adhere to an initial rest period, but they are often reluctant to do what is necessary to prevent future injuries. Most physicians recommend exercises to strengthen lower back and abdominal muscles, and regular stretching to increase flexibility. Some patients also need to lose weight, while others just need to practice good posture!

What can you do to lessen your chance of a lower back injury?

- Avoid repetitive or sustained bending over.
- Use a carrier for luggage, briefcases, or bags normally carried on the shoulder.
- Avoid awkward or unbalanced postures like sitting with weight shifted to one side, crossing your legs at the knees while sitting, or carrying your wallet in your back pocket.
- Sit up straight.
- Lose weight if you need to.
- Find someone to help with heavy awkward objects, or use a jack or dolly to lift and move items.
- Get plenty of rest on a mattress with adequate support.

Estimates indicate that four out of five adults will experience significant lower back pain sometime during their life. Avoid becoming a statistic, and you'll avoid the frustration of a long, slow recovery from this painful ailment.

MEDICAL TOOLBOX: *X-rays Help Doctors Diagnose & Treat Illness*

Patients used to be concerned about radiation exposure from x-rays. Today's radiological procedures, however, safely take pictures that play an important role in the diagnosis and treatment of your illness. X-rays look like a photographic negative. A special doctor called a radiologist interprets the picture and sends the results to your physician.

- **X-rays** are the most common radiological test, and some people use the term generically to describe other radiological procedures. X-rays commonly diagnose broken bones.
- **Bone densitometry**, a quick and painless test, shows whether a patient has a loss of bone mass, which makes older adults prone to fractures.
- After a dye is administered through an IV, an **intravenous pyelogram (IVP)** reveals kidney stones, an enlarged prostate, or a tumor.

- A **barium enema** is an x-ray of the colon and large intestine. The procedure sounds unpleasant, but it saves lives by revealing cancer, polyps, and diverticulitis (a bulge in the colon).
- An **upper GI (gastrointestinal)** reveals the esophagus, stomach, and small intestine after the patient drinks a special fluid. It allows diagnosis of ulcers, cancer, or intestinal blockage.
- **Pelvic sonograms** use sonar to detect abnormalities in an unborn baby. They can also reveal cysts or tumors in the pelvic area.
- A **mammogram** is a special breast x-ray that helps detect breast cancer early, often before a patient even feels a lump.
- During a **CT scan**, you lie very still while a machine takes pictures, usually of just one area (brain, chest, abdomen, etc.). Often it helps your doctor diagnose central nervous system disorders.

Other types of radiological procedures also help diagnose and treat diseases. Ask your doctor if you have any questions about why radiological procedures are ordered for you or how they are administered.

Parkinson's Disease Strikes All Age Groups

Parkinson's Disease (PD) affects approximately one million people in the United States. It is a neurological disorder (sometimes called a movement disorder) that progressively worsens. Certain brain cells quit producing dopamine, a chemical that carries messages about movement and balance. The resulting symptoms can be hard to detect at first because they are so subtle, but over time they increase and are hard to miss. Not all patients have all symptoms but common ones include:

- **Tremor in one or both hands, arms, legs, or face.**
- **Slowness of movement or stiff body parts (arms, legs).**
- **Difficulty initiating or maintaining movements.**
- **Balance instability or poor posture.**
- **Lack of facial expression.**

Ongoing research has led to highly effective treatments. Drugs that mimic dopamine bring amazing results, and surgical procedures work wonders at helping some people control symptoms.

Other treatments seem to help, too. Physical therapy builds strength and keeps muscles flexible, while speech exercises make it easier to talk. Counseling helps PD patients work through emotional swings common with the disorder, and many people say support groups help them maintain a positive attitude.

Parkinson's can strike at any age, and for those learning to live with PD, several organizations offer help through brochures, videos, and referral services:

Parkinson's Disease Foundation, Inc.

MyHealthVet: A New and Exciting Web-Based Program

By Spencer Ralston, MPA
Associate Director, SAVAHCS - Tucson

On Veterans Day of 2003, the VA proudly announced the launch of a new online website known as “MyHealthVet” where veterans, family, and VA clinicians can come together to optimize health care. This website offers perhaps the most advanced system for patient education and interaction available anywhere in this country.

By entering the worldwide web address www.myhealthvet.va.gov the veteran, his or her family members, and VA staff can register and access important and interesting health news and information. In Phase 1 of MyHealthVet, a vast health education library maintained by HealthGate offers MHV registrants the ability to search for information on virtually anything related to health, medical conditions, and drugs. A link to “Healthy Living Calculators” helps registrants assess their health status. A link to “Rx Checker” lets patients who are taking multiple medications be sure those medications are not adversely interacting with each other. Links to the “Women’s Health Guide” and the “Men’s Health Guide” offer comprehensive quick-reference guides to health conditions and medical procedures.

Phase 2 (scheduled to be online this summer) will be a tremendous addition to the MHV program. With this enhancement, VA-enrolled patients will have the ability to order their prescription refills online. They will also be able to view their co-payment balance and next scheduled appointment. Additionally, VA patients will be able to enter certain health information (such as weight), and even keep

a personal calendar. Eventually patients will be able to add such information as their blood pressure and blood glucose levels. All of this self-entered data will help the veteran and (if desired) his or her family and provider monitor progress in maintaining or improving health status.

Finally, in Phase 3 (which is expected to be rolled out during the winter of 2005), veteran patients will have the ability to view parts of their medical record, and share this information with those they designate – for example their spouse, children, community providers, etc. Also being developed is a way to allow two-way communication online between patients and providers.

Here are some interesting statistics: As of February 2004, over 15,000 people have registered for an MHV account. The

website averages 4,300 visits a day – with 70 percent of those coming from America Online (AOL) subscribers. The top five visiting states are California, Virginia, Texas, Georgia and Illinois. And, while close to 99 percent of all visitors were from the United States, there were visitors from such countries as Germany, the Netherlands, Canada, the United Kingdom, South Korea, Nigeria, Japan, Australia, China, and Spain.

For our patients, MyHealthVet offers a way to become a knowledgeable partner with physicians and nurses in terms of care and treatment. MyHealthVet is of great benefit to veterans, their families, and VA employees, and is just one more way that the Department of Veterans Affairs is providing high quality care to America’s heroes and heroines.
