Evidence Summaries

Evidence Summaries

- A summary of the best existing international evidence among the most common diseases and conditions.
- The summary always starts with a clinical question and the clinical bottom line “summary of the condition/disease/treatment”.
- Evidence is graded to indicate its importance, with complete references at the end showing the sources used.

The screenshot shows a document header for 'THE JOANNA BRIGGS INSTITUTE' with a logo. The title is 'Falls Prevention Strategies: Acute In-hospital setting', dated 29/04/2013, by author Alexa McArthur RN RM MPHc MClinSc. The document is structured into sections: 'Question' (What is the best available evidence regarding the effectiveness of acute in-hospital falls prevention strategies for adult patients?), 'Clinical Bottom Line' (Falls-related injury is one of the leading causes of morbidity and mortality in older people. For people aged 65 years and over, falls are responsible for more than 80% of injury-related admissions to hospital. For the elderly, the risk of falling is increased in the hospital setting. Admission to hospital is often associated with a change in physical or cognitive condition, which when combined with unfamiliar surroundings presents a high risk for falls. Falls are one of the most common adverse events experienced in hospitals. Reported in-hospital falls rates vary significantly depending on the setting. In the acute setting, rates from 2-5% have been reported and in rehabilitation settings, up to 40% of patients have been recording as falling at least once during their hospitalisation. In Australia in 2010-11, more than 22,000 falls resulting in patient harm were recorded as occurring in a health service area. This represents a rate of 2.5 per 1000 separations, with a higher rate in public hospitals (3.3) than in private hospitals (1.3). Injuries resulting from falls can be serious, and in some cases can lead to permanent disability or death. Falls can result in increased length of hospital stay, reduced quality of life and can leave patients with emotional distress and fear of a repeat fall. Falls are not only costly to the individual, but they are costly to the community. The proportion of the Australian population that is over 65 years of age is increasing, which will result in increased demand for health services for falls-related injuries. Unless effective preventive strategies are utilized, the cost attributable to falls-related injury is projected to increase three-fold to \$1375 million per annum by 2061.), and a final paragraph stating 'There are a number of factors that can contribute to in-hospital falls, including patient characteristics, staff behavior and the hospital environment. Some activities, such as getting out of bed, can increase the risk of falling. In addition, the risk of a fall can be influenced by the number and type of medications being taken by a patient. A large number

Evidence Based Recommended Practice

Evidence Based Recommended Practice Sheets

- Document detailing evidence based steps or procedures to take when treating a variety of diseases or conditions.
- Offers a list of tools at the beginning which inform what you will need use to undertake the procedure correctly.
- The practice sheets are always accompanied with an evidence summary making this a very complete document.

THE JOANNA BRIGGS INSTITUTE

Observation Following Falls in the Community: Older People

30/04/2013

Author
Dr Jared Campbell PhD, BHSoc(Hons)

Equipment
• Progress notes/record

Recommended Practice

If an older person has reported with a fall to a care worker/care giver or a clinician – either immediately after the fall or later during screening for recent incidents – an examination of the person's history and physical state should be undertaken by a qualified individual.

EXAMINATION OF HISTORY

- The time period and events just prior to the fall and what happened as a result of the fall (i.e. loss of consciousness, tripping or stumbling, light headedness, palpitations, difficulty getting up), should be investigated and documented
- A review of major intrinsic risk factors should then be completed including medical problems such as Parkinson's disease, stroke, cardiac, neuropathy, severe osteoarthritis and dementia by a physician
- A review of extrinsic risk factors including an environmental risk assessment should be conducted using an appropriate assessment tool, which should include an evaluation of bathroom and toilets, furniture, floor surfaces, lighting, passageways, lifts, external areas, security of environment and recommendations for remedial actions.
- A review of medications including vasodilators, diuretics, sedative and hypnotic drugs should also be completed with a particular focus on recent changes and adjustments.
- As assistive devices are often used incorrectly or set to the wrong height, it should be determined whether or not an assistive device is ever used – including those only used within the house – as well as whether it is being used appropriately.

PHYSICAL EXAMINATION

- Physical examination should focus on gait, balance and strength in addition to neurologic and cardiac examination.
- Gait, balance and quadriceps strength should form a large part of the physical examination.

Icons on the right: Book (Read the Literature), Hand being washed (Wash the Hands), Warning sign (Watch for Hazards), Scissors (Use Caution Tools), Checkmark (Check for Compliance)

Best Practice Sheets & Technical Report

Best Practice Sheets

- Document summarizing the data and recommendations of systematic reviews by specialised treatment areas.
- Offers health professionals easy to understand guidelines which they can apply directly in their daily practice.

Technical Reports

- The 'Technical Reports' detail all the steps and information used to create the Best Practice Sheets above.

The document is published as the Joanna Briggs Institute
contribution to reduce the incidence of falls in older adult patients in acute care hospitals
Best Practice: Addressing Evidence Information Issues for Health Professionals, 2010, 14(1): 1-4

Best Practice

Evidence-based information sheets for health professionals

Interventions to reduce the incidence of falls in older adult patients in acute care hospitals

Recommendations

- Introduction of multidisciplinary multifactorial intervention program including a falls risk alert card, an exercise program, an education program and the use of hip protectors after approximately 48 days is recommended to reduce falls in acute hospitals. (Grade A)
- Use of one-on-one patient education package providing information on risk factors and preventative strategies for falls as well as goal setting is recommended. (Grade A)
- Introduction of a targeted falls risk factor reduction intervention that includes a falls risk factor screen, recommended interventions encompassing local advice and a summary of the evidence is recommended. (Grade A)
- A multidisciplinary multifactorial intervention that consists of systematic assessment and treatment of fall risk factors, as well as active management of postoperative complications can reduce the amount of falls in patients with femoral neck fracture following surgery. (Grade A)
- A falls prevention exercise program as a standalone intervention which encompasses tai chi, functional re-education and activity visualisation. (Grade C)
- Short-term (approximately 30 days) vitamin D and calcium supplementation. (Grade C)

Information Source

This Best Practice Information sheet has been derived from a systematic review published in 2009¹ which was based on 7 randomised controlled trials. The primary studies on which this information sheet is based are available from the Joanna Briggs Institute in the form of a Technical Report which can be viewed at www.joannabriggs.edu.au

The systematic review was reported in www.joannabriggs.edu.au

Background

It has been estimated that one third of people aged over 65 years, and half of people over 80 years, suffer at least one fall per year. Falls can have a considerable impact on the well-being of older adult patients; they can result in serious physical and emotional injury, poor quality of life and increased length of hospital stay.

Falls are attributed to many factors including trauma, debilitating disease, environmental hazards, age, mental status, length of hospital stay and gender. Many interventions for the prevention of falls within the acute setting have been recommended from the literature such as environmental modification, reviewing medication, providing safer footwear for patients, encouraging regular exercise and others.

While there has been a large number of studies conducted and many papers published, patient falls continue to be a major problem for hospitals.

Grades of Recommendation

These Grades of Recommendation have been based on the JBI-developed 2008 Grades of Effectiveness²

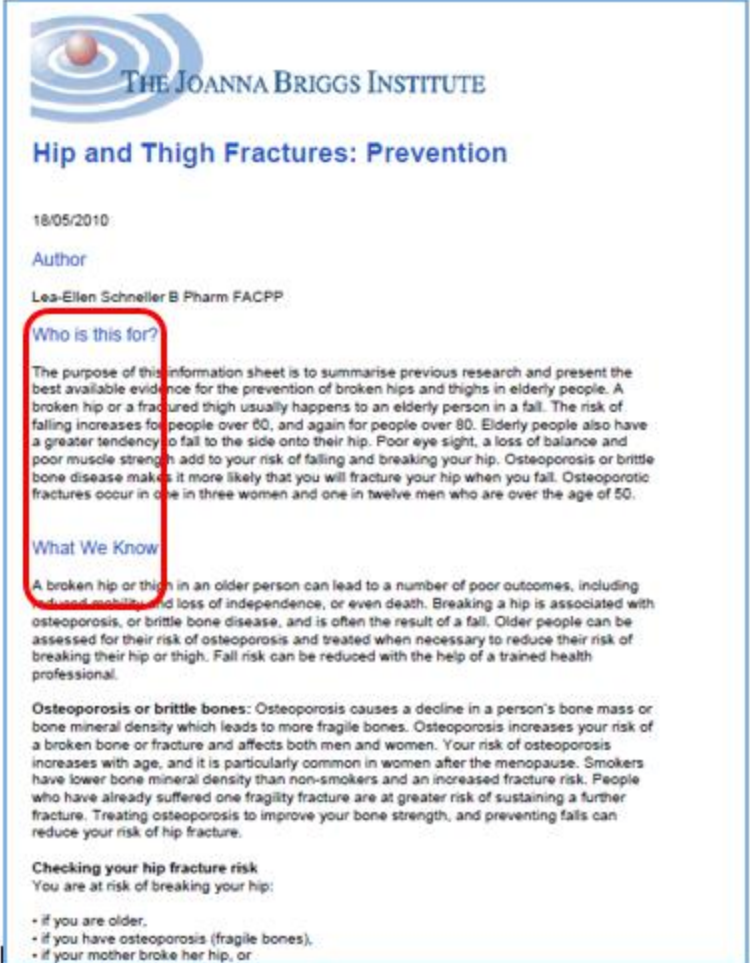

- Grade A: Strong support that warrants application
- Grade B: Moderate support that warrants consideration of application
- Grade C: Not supported

Interventions to reduce the incidence of falls in older adult patients in acute care hospitals Best Practice 14(1): 2010 1 1

Consumer Information Sheets

Consumer Information Sheets

- The information found in this documentation is always derived from Evidence Based Medicine.
- Concise information which is easy to digest within a 2 page format.
- Useful for both Health professionals as well as for patient information
- The JBI tool “Pamphlet Builder” allow users to create their own information sheet.

The screenshot shows a document header with the logo of The Joanna Briggs Institute. The title is "Hip and Thigh Fractures: Prevention". Below the title, it lists the date "18/05/2010" and the author "Lea-Ellen Schneller B Pharm FACPP". A red box highlights the section "Who is this for?" which contains text about the purpose of the sheet and the risk of hip and thigh fractures. Below this, there is a section "What We Know" which discusses the outcomes of a hip fracture and the role of osteoporosis. At the bottom, there is a section "Checking your hip fracture risk" with a list of risk factors.

THE JOANNA BRIGGS INSTITUTE

Hip and Thigh Fractures: Prevention

18/05/2010

Author
Lea-Ellen Schneller B Pharm FACPP

Who is this for?

The purpose of this information sheet is to summarise previous research and present the best available evidence for the prevention of broken hips and thighs in elderly people. A broken hip or a fractured thigh usually happens to an elderly person in a fall. The risk of falling increases for people over 60, and again for people over 80. Elderly people also have a greater tendency to fall to the side onto their hip. Poor eye sight, a loss of balance and poor muscle strength add to your risk of falling and breaking your hip. Osteoporosis or brittle bone disease makes it more likely that you will fracture your hip when you fall. Osteoporotic fractures occur in one in three women and one in twelve men who are over the age of 50.

What We Know

A broken hip or thigh in an older person can lead to a number of poor outcomes, including reduced mobility and loss of independence, or even death. Breaking a hip is associated with osteoporosis, or brittle bone disease, and is often the result of a fall. Older people can be assessed for their risk of osteoporosis and treated when necessary to reduce their risk of breaking their hip or thigh. Fall risk can be reduced with the help of a trained health professional.

Osteoporosis or brittle bones: Osteoporosis causes a decline in a person's bone mass or bone mineral density which leads to more fragile bones. Osteoporosis increases your risk of a broken bone or fracture and affects both men and women. Your risk of osteoporosis increases with age, and it is particularly common in women after the menopause. Smokers have lower bone mineral density than non-smokers and an increased fracture risk. People who have already suffered one fragility fracture are at greater risk of sustaining a further fracture. Treating osteoporosis to improve your bone strength, and preventing falls can reduce your risk of hip fracture.

Checking your hip fracture risk
You are at risk of breaking your hip:

- if you are older.
- if you have osteoporosis (fragile bones).
- if your mother broke her hip, or

Systematic Reviews & Protocols

Systematic Review

- Document offering a very detailed analysis of the current scientific international literature for specific treatments and therapies.

Protocols

- Document that shows the steps and methods being followed in order to conduct and complete a future systematic review.

Interventions to reduce the incidence of falls in older adult patients in acute care hospitals: a systematic review

Cindy Stem, BHS(Hons) PhD Candidate¹
Dr Rosika Jayasekara RN, BA, BScN (Hons), PG Dip Edu, MNQI, PhD²

1. The National Evidence Based Aged Care Unit (NEBACU), Adelaide Australia: a collaborating centre of the Joanna Briggs Institute.
2. The Joanna Briggs Institute, Adelaide Australia.

Corresponding author: Ms Cindy Stem, The National Evidence Based Aged Care Unit (NEBACU), Royal Adelaide Hospital, North Terrace, Adelaide SA 5000. Email: cindy.stem@adelaide.edu.au

Abstract

Background - Falls can have a considerable impact on a patients' well being, they can result in serious physical and emotional injury, poor quality of life and increased length of hospital stay. Most of the current literature recommends a comprehensive approach to fall prevention that addresses a wide variety of risk factors and involves the use of risk assessment.

Objective - The objective of this review was to present the best available evidence for the effectiveness of interventions designed to reduce the incidence of falls in older adult patients in acute care hospitals.

Inclusion Criteria

Types of Studies
Only randomised controlled trials (RCTs) assessing the effectiveness of risk assessment or other interventions that aimed to minimise the number of falls were included.

Types of Participants
Participants were older adult inpatients (defined as aged 65 years or over) in acute care hospitals.

Types of Interventions
This review focused on interventions designed to assess the risk of falling or those used to minimise the risk of falling in older adult hospital patients. These interventions were compared to either standard practice, which included any method or technique already in place at the facility, or no intervention.

Types of Outcome measures
The primary outcome was the number of patient falls during hospitalisation.

Search Strategy - A search for published and unpublished literature from 1998 to 2008 published in the English language was conducted using all major electronic databases. A

Stem et al Reducing incidence of falls © the authors 2009 page 942

JBI levels of evidence

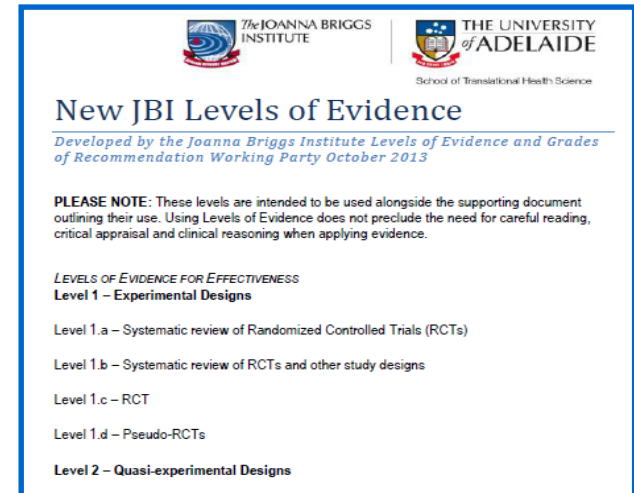

■ [JBI Levels of Evidence](#) (PDF)

- The JBI levels of evidence help describe the strength of the evidence found in the Evidence Summaries. JBI assigns levels 1 to 5 [1 systematic reviews, 5 expert opinions].

■ [JBI Grades of Recommendation](#) (PDF)

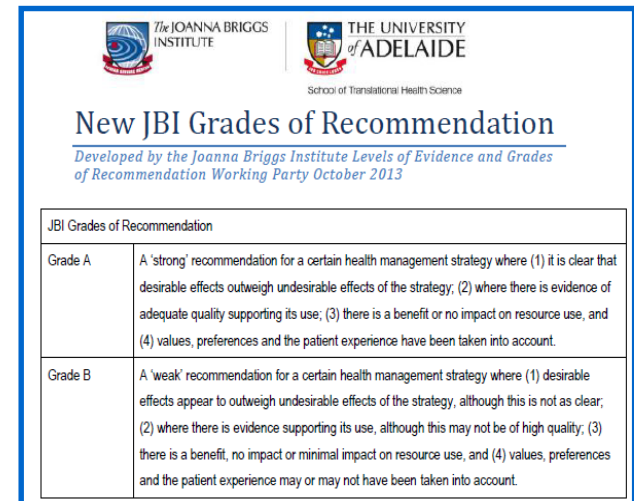

- Grading system that helps professionals to quickly establish the importance of the evidence. JBI assigns a level *[A or B] to its recommendations found within the Best Practice Sheets and the Evidence Summaries.

* Some older Best Practice Sheets will continue to show A, B, C, D grades.

The screenshot shows the cover page of the 'New JBI Levels of Evidence' document. It features logos for The Joanna Briggs Institute and The University of Adelaide. The title is 'New JBI Levels of Evidence', followed by the subtitle 'Developed by the Joanna Briggs Institute Levels of Evidence and Grades of Recommendation Working Party October 2013'. A 'PLEASE NOTE' section states that these levels are intended to be used alongside supporting documents and do not preclude the need for careful reading. Below this, the document is organized into 'LEVELS OF EVIDENCE FOR EFFECTIVENESS', with 'Level 1 - Experimental Designs' being the first category. Sub-categories under Level 1 include Level 1.a (Systematic review of RCTs), Level 1.b (Systematic review of RCTs and other study designs), Level 1.c (RCT), and Level 1.d (Pseudo-RCTs). 'Level 2 - Quasi-experimental Designs' is also listed.

Click on the image

The screenshot shows the cover page of the 'New JBI Grades of Recommendation' document. It features logos for The Joanna Briggs Institute and The University of Adelaide. The title is 'New JBI Grades of Recommendation', followed by the subtitle 'Developed by the Joanna Briggs Institute Levels of Evidence and Grades of Recommendation Working Party October 2013'. Below the title is a table titled 'JBI Grades of Recommendation'.

JBI Grades of Recommendation	
Grade A	A 'strong' recommendation for a certain health management strategy where (1) it is clear that desirable effects outweigh undesirable effects of the strategy; (2) where there is evidence of adequate quality supporting its use; (3) there is a benefit or no impact on resource use, and (4) values, preferences and the patient experience have been taken into account.
Grade B	A 'weak' recommendation for a certain health management strategy where (1) desirable effects appear to outweigh undesirable effects of the strategy, although this is not as clear; (2) where there is evidence supporting its use, although this may not be of high quality; (3) there is a benefit, no impact or minimal impact on resource use, and (4) values, preferences and the patient experience may or may not have been taken into account.

4 Conclusion - Systematic Review/ Meta Analysis

Authors Conclusions ?

Conclusion
The purpose of this review was to assess handwashing research approaches in LMIC and understand their impact with regard to long-term behaviour adoption. Our findings determined that the evidence base regarding successful, behaviourally based handwashing approaches is inadequate. While handwashing adherence is recognized as a foundation of health maintenance in communities and institutional settings, global health initiatives frequently overlook its importance and the need to support studies capable of determining the most effective approach for measuring and promoting its long-term adoption. Critical Appraisal for Intervention Study

	Yes	No	Unclear
1 The participants were randomised to study groups.	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>
2 Allocation to treatment groups was concealed from allocator.	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>
3 Other than the intervention, participants were treated the same.	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>
4 The groups were comparable at entry.	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>
5 The outcomes were measured in the same manner for all participants.	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>
6 Those assessing outcome were blinded to treatment allocation (if outcome not objective such as survival or length of hospitalisation).	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>
7 Outcomes were measured in a reliable manner.	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>
8 The statistical analysis used was appropriate for the data presented.	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>
9 There was adequate follow up of participants.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
In reflecting upon my critical appraisal I believe that this paper is			
<div style="border: 1px solid gray; padding: 5px;"><p>Please choose</p><p><input checked="" type="checkbox"/> of good quality</p><p><input type="checkbox"/> of poor quality</p><p><input type="checkbox"/> to be used with caution</p></div>			

Conclusions - Intervention Studies

RAP Title	An outreach geriatric medication advisory service in RAC: a RCT in
Authors Conclusions	Unable to show an effect in the objective measures of residents behaviours, this may be due to the low level of behavioural problems at baseline. Staff reported and improvement in behaviours suggesting a change in staff perceptions of the behaviours. Unable to show that the intervention had a flow on effect on other residents. This study provides evidence to support case conferences as an effective approach to providing recommendations on behavioural interventions.
Your Conclusions	Case conferences had no observable effect on problem behaviours. Residents were included in the study based on behavioural difficulties.

What is SUMARI ?

- What is SUMARI?

The System for the Unified Management, Assessment and Review of Information

- The new JBI SUMARI is designed to facilitate the entire review process, from protocol development, team management, study selection, critical appraisal, data extraction, data synthesis and writing a systematic review report

JBI SUMARI

Overview

Protocol

Studies

Appraisal

Extraction

Synthesis ▾

Review

The process of creating a systematic review involves the phases listed across the top of the screen

- What has changed?
- JBI SUMARI supports the entire review process, including allowing you to manage review teams and contributors to your review. It's now an online web-based application so there's no need to download and install any software. The new SUMARI supports more review types

What is SUMARI ?

■ The new SUMARI now supports more review types. What are the review types?

- Effectiveness Review
- Qualitative Review
- Cost/Economic Review
- Prevalence/incidence Review
- Diagnostic test accuracy
- Etiology/risk Review
- Text/opinion Review
- Mixed methods *
- Umbrella/overviews
- Scoping reviews
- Custom Review *

The Review Frameworks may be qualitative or quantitative, the steps that we see later, and the types of analysis and results are selected during the review

* you can choose to include multiple approaches within the one review.

Thematic Analysis Program

Appraise
the
evidence

A tool that allows researchers to use qualitative methods to find the best evidence.

What is Evidence Based Health Information?

Just as a detective searches for evidence to solve a crime, so too do health professionals look for evidence to guide their practice. The detective must have evidence to support their case. In a similar fashion, the health care professional must have evidence to support their proposed course of treatment. They search for information that will help them to provide the most effective or beneficial form of care to their patients. Due to the wealth of information available to them, the process of discovering which information is the best can be difficult and time consuming. It would take an enormous amount of time for your doctor to sift through the large amounts of research and information available to them on a particular topic. This is where the Joanna Briggs Institute comes into play. We conduct the 'detective' work, providing them (and you) with the best available evidence.

Evidence Reliability

The evidence related to the topic of each consumer publication produced by the Joanna Briggs Institute is assessed for reliability and quality. We do not rate a procedure or treatment, but the evidence (or research) that is available to support it. Evidence can play a critical role in any investigation and it is important for detectives to recognise evidence that will provide 'reliable' information to aid in the investigation.

This is also the case when assessing health information, as some types of evidence are more reliable than others. For Joanna Briggs Institute evidence based information for consumers, you can be assured that the best available evidence is utilised. If you would like more information about research and levels of evidence, please contact the Joanna Briggs Institute or visit the research page of our consumer web site.

"The procedures described in this pamphlet must only be used by people who have appropriate expertise in the field to which the procedure relates. The applicability of any information must be established before relying on it. While care has been taken to ensure that this pamphlet summarises available research and expert consensus, any loss, damage, cost, expense or liability suffered or incurred as a result of reliance on these procedures (whether arising in contract, negligence or otherwise) is, to the extent permitted by law, excluded".

What does this mean for consumers?

As consumers of health care it is important to know that your treatment is being based on the best available evidence. It is also important that you are provided with all of the information in order to have greater independence in relation to your own health care decisions and to be involved in the decision making process.

Further Information

The Joanna Briggs Institute Consumer Information Program provides up to date literature reviews to ensure your information is based on the best available evidence. The Institute also produces systematic reviews and Best Practice Information sheets aimed at clinicians and health professionals. This means you are provided with the same high standard of publications based on the same information as those working directly in the field.
