Evidence-based Integrative Medicine

Anna Rusiewicz, PhD
Health Science Specialist
RAC : March 1, 2011

National Institute of Health:
- Complementary & Alternative Medicine (CAM)
  - A group of medical and health care systems, practices and products not presently considered to be part of conventional medicine.
- Complementary medicine
  - Used in conjunction with conventional medicine.
- Alternative medicine
  - Used in place of conventional medicine.
- Integrative medicine
  - Combination of mainstream conventional medicine and CAM therapies for which there is some high quality scientific evidence.
5 Categories of CAM (NCCAM)

- Whole Medical Systems
  - Traditional Chinese medicine (TCM)
  - Ayurvedic medicine
  - Homeopathy
  - Naturopathy
Traditional Chinese Medicine

- Acupuncture
  - WHO Lists acupuncture as safe and effective for 28 conditions
  - Highlights
    - Headache, Hypertension, Depression, Pain
  - Results seen but more research required
    - Craniocerebral injury
    - Diabetes mellitus, non-insulin-dependent
    - Ménières disease

Presented by the VA NJ War Related Illness and Injury Study Center (WRIISC)

---

Traditional Chinese Medicine

- Acupuncture
  - Currently funded Veteran Clinical trials
    - East Orange WRIISC (PIs: Rusiewicz/Findley)
      - Veterans with TBI and PTSD
      - 24 individual sessions acupuncture
      - Outcome = Well-being (SF-36)
    - DC WRIISC (PI: Prisco)
      - Veterans with PTSD
      - Group delivery – Auricular acupuncture
      - Outcome = Sleep (Insomnia Severity Index; actigraphy)

Presented by the VA NJ War Related Illness and Injury Study Center (WRIISC)
Traditional Chinese Medicine

- Acupuncture – Energy Medicine
- Herbal Medicine - Biologically Based
- Qigong – Mind-Body Medicine
- Tui Na – Manipulative & Body-Based Practices
- Eastern Dietary therapy - Biologically Based

Alternative vs. Integrative

- “Alternative” in lieu “conventional”
- Outside of normal
- Add-on Treatment

- Embrace evidence-based treatments
- Synergy
- 1+1=3

Presented by the VA NJ War Related Illness and Injury Study Center (WRIISC)
VA Standard for Evidence-Based

- CAM modalities permitted within VA must be safe and effective.
  - Evidence = USPTF equivalent rating of B or better
    - At least fair evidence practices improves important health outcomes and benefits outweigh harms. There is a sufficient, strong and consistent evidence of positive effect.
  - Practices without clear evidence of effectiveness may be considered if:
    - There is some evidence of effectiveness
    - They are known to be safe
    - Treatment options are limited
    - Provider believes it may offer benefit to veteran

Quality of Evidence

- Who is doing the intervention?
  - Practitioner training
- Study Designs
  - Randomized controlled clinical trials- few
  - Uncontrolled trials- the majority
  - Appropriate controls?
- Sample Size
- Rigor

Presented by the VA NJ War Related Illness and Injury Study Center (WRIISC)
Quality of Evidence cont.

- Who is the patient population?
  - Civilians
    - Majority of research on CAM modalities is conducted in civilians
  - Active Duty Military
    - Mounting research on acupuncture, supplements and others
  - Veterans
    - Yoga for back pain, acupuncture for PTSD

Quality of Evidence cont.

- What are the outcomes?
  - Quality of life
    - Increasing comfort
    - Emphasis on overall wellness
  - Symptoms
    - Minimizing burden, impact
    - Emphasis on treatment
  - Compliance
Compliance

- A critical issue in conventional medicine
  - Chronic conditions requiring complex treatment regimens
- Thus, CAM modalities with highest promise for success will involve simple practices that require fewer hospital visits
- Self-care practices vs. practitioner dependent

Challenge for Research

- High rates of CAM use in veterans and civilians alike
- Plus, high rates of lack of reporting of CAM use to conventional practitioners
- Therefore, CAM research will be best served recognizing that actual use is already integrative

Presented by the VA NJ War Related Illness and Injury Study Center (WRIISC)
CAM Intervention Improves Compliance to Diabetes Lifestyle

- 20 children with diabetes
- Randomly assigned to either:
  - Treatment Group: Massage therapy
  - Control Group: Relaxation therapy
- Outcomes:
  - Well-being: Parent and Child Mood
  - Biomarkers: Blood glucose
  - Behaviors: Insulin and food intake

Findings: Massage for Diabetes

- Compliance to diabetes lifestyle improved
  - Better compliance with insulin
  - Better compliance with food intake
  - Blood glucose decreased to normal range
  - Reduced parent anxiety & depressed mood
  - Reduced child anxiety, fidgetiness, & depressed mood
Chronic Multisymptom Illness

- Nearly 40% of veterans that served in the Persian Gulf War suffer from an array of mood and cognitive symptoms, persistent fatigue and musculoskeletal pain.

CMI: Standard Care

- Of tested treatments, aerobic exercise has been shown to reduce CMI symptom severity.
- Unfortunately, long-term compliance is very poor:
  - 76% of Gulf veterans completing a structured exercise program fail to meet exercise recommendations long-term.

Presented by the VA NJ War Related Illness and Injury Study Center (WRIISC)
Promise of Eastern Forms of Exercise

- Beginners Mind
- Movements naturally gentle
- Opposite to the basic training mindset
  - “no pain, no gain”
- Yet, similar physical benefits as conventional forms of aerobic exercise

Tai Chi for Heart Failure: Veterans Study

- 40 HF patient completers (37-81 years; mean age=68.8, SD=4.2)
  - tai chi (n = 15), standard exercise sub-group (n = 10), usual care (n = 15)
- Tai Chi classes for 12 weeks (twice week)
- Fatigue
  - Multidimensional Fatigue Symptom Inventory
- Depression
  - Beck Depression Inventory

Presented by the VA NJ War Related Illness and Injury Study Center (WRIISC)
Results: Fatigue

BDI Scores pre- to post- Intervention (N = 15/group)

(F(1,29)=4.8, p = .036)

Results: Depression

BDI Scores pre- to post- Intervention (N = 15/group)
Results: Depression cont.

Subjects with BDI scores > 10 (N = 6/group)

Qigong

- Simple movements can be used as physical therapy for all ages and physical abilities.
- Health benefits similar to moderate aerobic exercise.
- Improvements observed in:
  - Stress regulation
  - Heart function- blood pressure
  - Lung function- oxygen uptake
Qigong - Efficacy

- Strongest evidence for
  - Fibromyalgia
  - Balance
  - Hypertension

- Preliminary evidence for
  - Chronic Fatigue Syndrome

Impact of Fatigue on Veterans

- Of 532 veterans seen at the NJ WRIISC
  - 48.5% report fatigue for more than 6 months with 50% reductions in activity across two or more of four domains: work, school, home, and social functioning.
  - poorer physical functioning compared with their non-fatigued veteran counterparts.
New WRIISC study

- Qigong for Gulf War Veterans with Fatigue
  - 12 sessions Qigong or Standard Exercise
  - Outcomes:
    - Compliance: in class and home practice
    - Physical Function: SF-36, 6 min walk
    - Symptoms: fatigue, pain, mood & cognitive
    - Physical Activity: actigraphy
    - Overall well-being

Final Thoughts

- Challenges to meeting clinical needs of the Veteran population
  - Complex Comorbidities (PTSD/mTBI)
  - Medically unexplained & difficult to treat symptoms (pain, headache, balance)
- Wide use of CAM, limited evidence, even more limited in veterans
- Need for integrative models = opportunity for VA
Thank you
