Naldemedine (SYMPROIC) Criteria for Use
February 2019
VA Pharmacy Benefits Management Services, Medical Advisory Panel, and VISN Pharmacist Executives

The following recommendations are based on medical evidence, clinician input, and expert opinion. The content of the document is dynamic and will be revised as new information becomes available. The purpose of this document is to assist practitioners in clinical decision-making, to standardize and improve the quality of patient care, and to promote cost-effective drug prescribing. THE CLINICIAN SHOULD USE THIS GUIDANCE AND INTERPRET IT IN THE CLINICAL CONTEXT OF THE INDIVIDUAL PATIENT. INDIVIDUAL CASES THAT ARE EXCEPTIONS TO THE EXCLUSION AND INCLUSION CRITERIA SHOULD BE ADJUDICATED AT THE LOCAL FACILITY ACCORDING TO THE POLICY AND PROCEDURES OF ITS P&T COMMITTEE AND PHARMACY SERVICES.

The Product Information should be consulted for detailed prescribing information.

See the VA National PBM-MAP-VPE Monograph on this drug at the PBM INTRAnet site for further information.

Exclusion Criteria
If the answer to ANY item below is met, then the patient should NOT receive naldemedine.

☐ Age less than 18 years
☐ Known or suspected gastrointestinal obstruction or at risk of recurrent obstruction
☐ Concomitant use with strong CYP3A4 inducers (e.g., rifampin, carbamazepine, phenytoin, St. John’s Wort)
☐ Concomitant use with other opioid antagonists
☐ Severe hepatic impairment (Child-Pugh class C)
☐ Hypersensitivity to naldemedine or product excipients
☐ Presence of severe or frequent diarrhea

Inclusion Criteria
The answers to ALL of the following must be fulfilled in order to meet criteria.

☐ Patient is taking opioids for chronic, non-cancer pain (including chronic pain related to prior cancer or its treatment), does not require frequent opioid dose escalation AND is documented to have opioid induced constipation (OIC).

☐ Documentation of attempts to reduce constipation by change to less constipating analgesics or reduction of opioid dose OR medical justification why changes are unable to be made in current regimen.

☐ Documentation that benefits of opioid therapy exceed risks for this patient and all VA / DOD Directives / guidelines for prescribing and monitoring long-term opioids are being followed. See Provider Practice Standards under Issues for Consideration.
Intolerance or inadequate response to 1-month trials of the following agents (also see Table 1), unless there is a contraindication or risk factor(s) for serious adverse event(s):

- One stimulant laxative (e.g., bisacodyl, sennosides)
- MIRALAX equivalent (twice daily) or other osmotic laxative (e.g., sorbitol, lactulose, magnesium (Mg) citrate, Mg hydroxide, glycerin rectal suppositories (RS))

**Maintenance laxative therapy does not need to be discontinued before starting naldemedine.**

*Bulk forming laxatives are relatively contraindicated in OIC. A stool softener (e.g., docusate) is considered to be of low benefit and low harm for OIC and may be used but is not required prior to use of naldemedine in OIC.*

<td>Oral Capsule or Solution</td>
<td>50 mg once daily</td>
<td>50–360 mg in 1–4 divided doses</td>
<td>500 mg in 1–4 divided doses</td>
</tr>
<tr>
<td></td>
<td>Rectal enema</td>
<td>Add 50-100 mg of docusate liquid (not syrup) to enema fluid (saline or water)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>LACTULOSE</td>
<td>Syrup</td>
<td>10 g (15 ml) once daily</td>
<td>10–20 g / day (15–30 ml / day) in 1–2 divided doses</td>
<td>60 ml / day in 1–2 divided doses</td>
</tr>
<tr>
<td>PEG 3350</td>
<td>Powder for solution, oral</td>
<td>17 g (about 1 heaping Tbsp) of powder mixed in 4–8 oz of water, juice, cola, or tea once daily for not longer than 2 weeks (OTC labeling). The OTC product labeling gives no limit on how frequently a course may be repeated. Under medical supervision, if the laxative response is insufficient, the dose may be increased to twice daily (off-label). Daily use (17 g/d) for constipation has been shown to be generally safe in otherwise healthy adults for up to one year.</td>
<td></td>
<td></td>

</tbody>
</table>

### Dosage and Administration

- **Dosage in Adults:** 0.2 mg once daily with or without food.
- **Alteration of analgesic dosing regimen prior to initiating naldemedine is not required.**
- **Patients receiving opioids for less than 4 weeks may be less responsive to naldemedine.**
**Issues for Consideration**

- In clinical trials, **opioid-induced constipation** was defined as meeting three criteria: (1) ≤3 spontaneous bowel movements (SBMs) per week during a 2-week run-in period and a total of ≤4 SBMs during the entire 2-week run-in period; (2) ≥1 of the following symptoms for ≥25% of bowel movements: straining, lumpy or hard stools, sensation of incomplete evacuation, or sensation of anorectal obstruction / blockage; and (3) at least 78% compliance with daily completion of diary entries during the 2-week qualifying period.
  - SBMs were defined as bowel movements without rescue laxatives taken within the past 24 hours.
  - Response was defined as ≥3 SBMs per week and an increase from baseline of ≥1 SBM per week for at least 9 of the 12 study weeks and 3 of the last 4 weeks.
- Patients have reported symptoms consistent with **opioid withdrawal** (e.g., abdominal pain, diarrhea, nausea, vomiting, hyperhidrosis, pyrexia, and anxiety). Disruptions in the blood-brain barrier may increase the risk of opioid withdrawal or reduced analgesia. It is recommended that the prescriber monitor for opioid withdrawal symptoms.
- **No gastrointestinal perforations** were reported in clinical trials studying naldemedine; however, agents in this class carry a warning for gastrointestinal perforation and are contraindicated in patients with gastrointestinal obstruction and patients at increased risk of recurrent obstruction because of the potential for gastrointestinal perforation. Use with caution in patients at risk for gastrointestinal perforation, such as those with peptic ulcer disease, diverticular disease, infiltrative gastrointestinal malignancy, peritoneal metastases or Crohn’s disease.
- **Drug Interactions**
  - Avoid concomitant use with strong CYP3A inducers and other opioid antagonists (see Exclusion Criteria).
  - Monitor for naldemedine-related adverse reactions during concomitant use with moderate CYP3A4 inhibitors (e.g., fluconazole), strong CYP3A4 inhibitors (e.g., itraconazole), and P-gp inhibitors (e.g., cyclosporine).
- **Pregnancy.** There is no human data. A potential exists for opioid withdrawal in the fetus. Weigh risks vs. benefits.
- **Nursing Mothers.** There is no human data. Weigh risks vs. benefits. Breastfeeding may be resumed 3 days after the final dose of naldemedine.
• **Practice Standards for Provision of Opioid Therapy.** General principles, defined by CDC and VA/DoD Clinical Practice Guidelines for prescribing of opioids for chronic pain, should be utilized to guide management of long-term opioid therapy. Practitioners should obtain informed consent from each patient after explaining the risks, benefits, and obligatory terms of long term treatment with opioids. All federal and state guidelines on prescribing and dispensing opioids should be strictly followed. There should be an initial and periodic checking of the respective SPDMP (if available), consideration of provision of naloxone rescue, and exercise of other strategies to mitigate risk of chronic opioid therapy. Providers should ensure risk mitigation strategies are in place when starting opioids per the VA / DOD Clinical Practice Guideline on the Management of Opioid Therapy (OT) for Chronic Pain (2017) [https://www.healthquality.va.gov/](https://www.healthquality.va.gov/). These strategies include an informed consent conversation covering the risks and benefits of opioid therapy as well as alternative therapies. Other strategies and their frequency should be commensurate with risk factors and include: ongoing, random urine drug testing (including appropriate confirmatory testing); checking state prescription drug monitoring programs; monitoring for overdose potential and suicidality; providing overdose education; and prescribing of naloxone rescue and accompanying education.

### Initial Prescription Supply
- Up to 2 weeks.

### Renewal Criteria
- Patient experiences clinically important benefit (i.e., improved constipation and abdominal pain) after an adequate therapeutic trial and tolerates treatment.
- An adequate therapeutic trial is 1 week.
- Discontinue naldemedine if treatment with the opioid pain medication is discontinued.

---
