Clinical Reminders

Manager’s Manual

(Revised May 2021)

March 2005

Product Development
Office of Information and Technology
Department of Veterans Affairs
Preface

Purpose of Manager’s Manual

This manual provides reference information for Clinical Reminders menus and options. It can serve both as a reference manual and a tutorial for Clinical Application Coordinators (CACs) and Clinical Reminders Managers who are just becoming familiar with Clinical Reminders.

To get further help information, please enter a Remedy ticket or call the National Help Desk.

Recommended Users

- Clinical Reminders Managers
- Clinical Application Coordinators (CACs)
- Department of Veterans Affairs Medical Center (VAMC) Information Resources Management (IRM) staff

Related Manuals

Clinical Reminders documentation can also be found in the VistA Software Document Library (VDL).

Introduction

The Clinical Reminder system helps caregivers deliver higher quality care to patients for both preventive health care and management of chronic conditions, and helps ensure that timely clinical interventions are initiated.

Reminders assist clinical decision-making and also improve documentation and follow-up, by allowing providers to easily view dates when certain tests or evaluations were performed and to track and document when care has been delivered. They can direct providers to perform certain tests or other evaluations that will enhance the quality of care for specific conditions. The clinicians can then respond to the reminders by placing relevant orders or recording clinical activities on patients’ progress notes.

Clinical Reminders may be used for both clinical and administrative purposes. However, the primary goal is to provide relevant information to providers at the point of care, for improving care for Veterans. The package benefits clinicians by:

- Providing pertinent data for clinical decision-making
- Reducing duplicate documenting activities
- Assisting in targeting patients with particular diagnoses and procedures or site-defined criteria
- Assisting in compliance with VHA performance measures and with Health Promotion and Disease Prevention guidelines

Patch 42 (PXRM*2.0*42) Changes

This patch modified Clinical Reminder functionality to support the Coronavirus Disease (COVID) v2.0 updates.

This new functionality, called CSUB Objects, includes the ability to display the data for any finding in Found/Not Found Text.

This functionality was implemented in PXRM*2.0*46. However, it wasn’t documented until the PXRM*2.0*42 release.

Patch 45 (PXRM*2.0*45) Changes

This patch modified Reminder Dialog and Reminder Order Check functionality to support the TDrugs and the SMART projects being implemented in CPRS 31.B.

Patch 47 (PXRM*2*47) Changes

This patch is the follow-up to PXRM*2*26, which was part of the Computerized Patient Record System CPRS v30 project. That project modified the Computerized Patient Record System, Text Integration Utilities, Consults, Health Summary, Problem List, Clinical Reminders, and Order Entry/Results Reporting domains to meet the requirements proposed by the Dept. of Health and Human Services to replace the ICD-9 code set with the ICD-10 code set. It removes the taxonomy fields made obsolete by PXRM*2*26, adds the taxonomy editor actions that could not be completed for the release of PXRM*2*26, and fixes some defects.
One of the bugs that is fixed involves display of the status line when the frequency is in hours. This change adds time to the Date Due and Last Done fields. Because there are a number of Clinical Reminders Health Summary components, a Health Summary patch is required, it is: GMTS*2.7*113.

**Patch 53 (PXRM*2*53) Changes**

PXRM*2*53 adds a Reminder Dialog Search Report option to the Reminder Dialog Report menu. The Reminder Dialog Search Report allows sites to find Reminder Dialogs based on search criteria such as Coding Systems, Findings, and Dialog Items.

**Patch 26 (PXRM*2*26) Changes**

PXRM*2*26 is part of the ICD-10 project, and the purpose of patch 26 and its related patches (DG*5.3*853 and GMPL*2*43) is to update Clinical Reminders to allow the use of ICD-10 codes. A very general approach has been taken, wherein Clinical Reminders taxonomies are being restructured to be Lexicon-based instead of pointer-based. This allows the use of any coding system supported by the Lexicon Utility. In addition to adding ICD-10 codes, SNOMED CT codes are being added. After the release of CPRS 29, SNOMED CT codes will be collected by Problem List and Clinical Reminders will be able to search for them.

A new taxonomy management system replaces the previous taxonomy management menu. See the Taxonomy Management chapter for details and examples. Also see the Dialog management chapter for information and examples of the changes made to Dialog options by this patch.

The new system uses a combination of List Manager, ScreenMan, and the Browser. List Manager should already be familiar to users of Clinical Reminders tools such as Dialog Management or Reminder Exchange. ScreenMan and the Browser may not be as familiar, but reviewing Appendix B of this manual or the FileMan documentation should give you enough knowledge to make using the taxonomy management system much easier.

After PXRM*2*26 is installed, users will no longer be able to add ICD-9-CM and/or CPT-4 codes to a Reminder Dialog. Users will need to create a Taxonomy, assign codes, and then add the Taxonomy to the Reminder Dialog. To maintain similar end user functionality in CPRS, a new called Taxonomy Pick List Display has been added to the dialog editor. This controls how Taxonomies should display in CPRS.

A simple taxonomy editor that is accessed from Dialog Management (either the element or group view) is available. Codes added in this editor are automatically marked as Use In Dialog. If a code is deleted in this editor, the Use In Dialog designation is removed from the code.

A change to Reminder Exchange was made to add a check of the line length and a warning if a line exceeds 245 characters. The maximum value allowed by Kernel is 255 characters, but for FileMan word-processing fields, it is 245. When a line exceeds this length, there is a very high probability that the Exchange entry will not install correctly. If the Exchange entry is transported as a host file, then 255 should work, but if is transported as a MailMan message, then 245 is the limit. The warning was added because previously, when an Exchange entry would not install correctly due to the line length being exceeded, it was difficult to determine the reason. The solution was to shorten the length of the field being transported. Detailed information about the field that needs to be shortened is given in the warning.

Example:
Warning the following line exceeds the VistA maximum allowed length of 245. Therefore this Exchange entry will not transport correctly.

Line: 811.23;+619,+617,.01-Telephone Assessment/Management by Nonphysician to Established PT/Parent/Guardian not Originating from A/M Provided within Previous 7 Days Nor Leading to A/M Service/Procedure within Next 24 Hrs/Soonest Appt; 11-20 Mins Medical Discussion

Its length is: 260

Component: REMINDER TAXONOMY
Name: PBM PHARMD PHONE VISIT CPT CODE 98967 V5*1
IBN: 617
Field number: .01
Value: Telephone Assessment/Management by Nonphysician to Established PT/Parent/Guardian not Originating from A/M Provided within Previous 7 Days Nor Leading to A/M Service/Procedure within Next 24 Hrs/Soonest Appt; 11-20 Mins Medical Discussion

Disable/Enable Reminder Evaluation

The option PXRM INDEX BUILD provides the ability to rebuild selected portions of the Clinical Reminders Index. (For information and details about the Clinical Reminders Index see the Clinical Reminders Index Technical Manual.) While an index is rebuilding, any reminder that uses the data from that index cannot be correctly evaluated — it will have the status of CNBD (cannot be determined). In the past, a MailMan message was sent to the Clinical Reminders mail group every time a reminder could not be evaluated because an index was rebuilding. Now, when an index is going to be rebuilt, reminder evaluation will be automatically disabled, meaning that any attempt to evaluate a reminder will result in an immediate return of a CNBD status. The Clinical Maintenance display will include text letting the user know that reminder evaluation is disabled and the reason(s). When the index has finished rebuilding, evaluation will be automatically enabled.

The option PXRM DISABLE/ENABLE EVALUATION provides a manual disable/enable function. If for some reason, reminder evaluation needs to be disabled, it can be done through this option. This option should be given to a very limited number of people and can only be used by holders of the PXRM MANAGER key. When the issue that required disabling evaluation has been handled, reminder evaluation can be enabled again using this same option. Note that this option can be used to enable evaluation even if it was not disabled using this option. For example, if reminder evaluation was automatically disabled for an index rebuild, this option could be used to enable evaluation even though the index is still rebuilding. If that is done, the MailMan messages will start being sent again.

When reminder evaluation is disabled, the following options and protocols will be put out of order.
Options:
PXRM DEF INTEGRITY CHECK ALL
PXRM DEF INTEGRITY CHECK ONE
PXRM ORDER CHECK TESTER
PXRM REMINDERS DUE
PXRM REMINDERS DUE (USER)

Protocols:
PXRM PATIENT LIST CREATE
PXRM EXTRACT MANUAL TRANSMISSION

When reminder evaluation is again enabled, these options and protocols will be put back in order.

Anytime reminder evaluation is disabled, a message with the subject “REMINDER EVALUATION DISABLED” will be sent to the Clinical Reminders mail group. The message will give the date and time...
that evaluation was disabled, list the reasons for disabling evaluation, and a search will be made for any Clinical Reminders TaskMan jobs that could be affected. There will be a list of those that are found; it will include the job description, the status (pending or running), and the task number. The results of any jobs that are already running will be unreliable and should be discarded. If possible, these jobs should be stopped, so that they don’t waste system resources. None of the pending jobs should be allowed to start until evaluation is enabled again.

When evaluation is enabled, a message with the subject “REMINDER EVALUATION ENABLED” will be sent to the Clinical Reminders mail group. It will contain the date and time evaluation was disabled and when it was enabled. This gives you the exact period of when evaluation was disabled.

Here are examples of disable and enable messages:

```
MailMan message for CRMANAGER, TWO
Printed at EXAMPLE.ORG.EXAMPLE.VA.GOV 04/16/14@10:32
Subj: REMINDER EVALUATION DISABLED [#122941] 04/16/14@10:30 58 lines
From: POSTMASTER (Sender: CRMANAGER, ONE) In 'IN' basket. Page 1

Reminder evaluation was disabled on Apr 16, 2014@10:30:42.
Because of this, the following TaskMan jobs can produce erroneous results.
The results of running jobs should be discarded and if possible, running jobs should be stopped.
Reason: index rebuild for file #45.

Reminders Due Report Jobs
Task number - 316820
Status - Active: Running
Time - Feb 08, 2012@12:40:28
User - CRCOORDINATOR, TWO

User - CRCOORDINATOR, SIX

Task number - 1902474
```
See the Revision History in this manual and the Release Notes for additional changes made by PXRM*2*26.

**Patch 31 (PXRM*2.0*31)- Palliative Care National Clinical Template**

This patch releases the Palliative Care National Clinical Template without any changes to routines, data dictionaries, or other package functions – “content” only. The reminder dialog is VA-PALLIATIVE CARE NATIONAL CLINICAL TEMPLATE (PC-NCT).

There are two Reminder Exchange entries that will be installed as part of this patch.
1. VA-PALLIATIVE CARE CONSULT
2. VA-PATCH 31 POST HS COMPONENTS

The VA Hospice and Palliative Care (HPC) program office has sponsored the development of this reminder dialog template to document provider-based palliative care consultations at all sites within VHA. This template is critical to improving the process and documentation of clinical care, and facilitating high quality palliative care and programmatic quality improvement. It is the intent of the HPC program office that this national template be formally distributed to VA palliative care programs for voluntary use throughout VHA in early 2014.
Patch 36 (PXRM*2*36) Changes - Pneumococcal Reminders and Women’s Health Taxonomy update

This patch installs two new or modified pneumococcal reminders, two new dialogs, and several new or modified terms and taxonomies, based on new guidelines. ACIP recommends that adults aged >=19 years with immuno-compromising conditions, functional or anatomic asplenia, CSF leaks, or cochlear implants, and who have not previously received PCV13 or PPSV23, should receive a dose of PCV13 first, followed by a dose of PPSV23 at least 8 weeks later (Table). Subsequent doses of PPSV23 should follow current PPSV23 recommendations for adults at high risk. See the patch 36 Installation Guide for further details.

Patch 34 (PXRM*2*34) Changes - Teratogenic Medication Reminder Order Check Update

The Teratogenic Medications Order Check Interim Solution was originally released as VistA patch PXRM*2*22 in July 2012. The interim solution is intended to have regular updates for clinical content, primarily to add newly approved medications with FDA Pregnancy Categories that warrant an order check. This patch, PXRM*2*34 represents the first such update. Included in this update are new medications, order check text changes consistent with the Notification of Teratogenic Medications project, support for reversal of tubal ligations, and updates to the taxonomies that define a women’s medical inability to conceive a pregnancy.

This patch also includes an update to a single dialog element for the Epilepsy Initial note that was released with PXRM*2.0*30. That element had a mapped Health Factor Category, instead of a mapped Health Factor. This element updates that mapped item.

Patch 24 (PXRM*2*24) Changes

The High Risk Mental Health Patient – Reminder & Flag project was released in two phases; the first phase was released in March 2012 with PXRM*2*18.

Phase 1 of this project provided the following:
1. Two new Scheduling reports that identify no-show “high risk for suicide” patients that missed their MH appointments,
2. A new national reminder and reminder dialog that will be used by providers to document results of following up with a high risk for suicide patient that missed a MH appointment, and
3. A new health summary type with MH-specific supporting information.

Phase 2 of this project provides the following:
- DG*5.3*849 – DGPF New Category 1 Flag and Conversion.
- TIU*1*265 – New PRF Category 1 Title - HIGH RISK FOR SUICIDE
- SD*5.3*588 – New proactive reports that list appointments for High Risk for Suicide patients who have appointments for the day. MHTC has been added to these reports and also to the background nightly job no-show reports.
- PXRM*2*24 – New patch that includes an updated reminder (VA-MH HIGH RISK NO-SHOW FOLLOW-UP), a new computed finding (VA-PCMM MHTC), a new dialog that will display the MHTC, two new Reminder Definitions (VA-MH HIGH RISK NO-SHOW ADHOC RPT and
VA- MHTC NEEDS ASSIGNMENT), and a new location list, VA-MHTC APPT STOP CODES LL, which is used in the Computed Finding: VA-Appointments for a Patient. The new Reminder Location List is consistent with the national list of MH Encounter Stop Codes defined for sites by the Office of Mental Health Services.

- OR*3*348 – Order Entry changes for the Mental Health Treatment Coordinator - Ability to select a Mental Health Treatment Coordinator as a notification recipient to receive notifications in CPRS. A new notification is also being released with this patch: SUICIDE ATTEMPTED/COMPLETED. This informational notification is triggered by Clinical Reminders when a MH SUICIDE ATTEMPTED or MH SUICIDE COMPLETED health factor has been documented in PCE.
- GMTS*2.7*104 - modifies two entries in the Health Summary Component file (142.1): MH HIGH RISK PRF HX and MH TREATMENT COORDINATOR. These components are used in the VA-MH HIGH RISK PATIENT and REMOTE MH HIGH RISK PATIENT Health Summaries, as well as being available for use in the Health Summary Ad hoc Report.
- Suicide Behavior Report (SBR) instrument – The SBR is a new mental health template and a new entry in the MH TESTS & SURVEYS file (#601.71). It was distributed nationally in YS*5.01*103, as an enhancement to the Mental Health Assistant 3.0 Package. This instrument can be used by MH professionals to assess and reassess the High Risk for Suicide patient’s behavior.

**Patch 23 (PXRM*2*23) Changes**

This patch is part of a multi-package build that contains FB*3.5*138 and PXRM*2.0*23. It supports the third increment for Project ARCH (Access to Care Received Closer to Home).

**FB*3.5*138:**
This build adds the PROJECT ARCH REMINDER DELAY field (#38) to the FEE BASIS SITE PARAMETERS file (#161.4) that allows sites to customize number of days that the Project ARCH Clinical Reminder will become due again after the patient Declines or Refuses services offered. Two new options are also installed on the Project ARCH Menu. The ARCH Eligibility Data Upload option allows sites to upload the national Project ARCH data extract files that contain the updates for Project ARCH Eligibility. The ARCH Clinical Reminder Due Delay option sets the value in the new PROJECT ARCH REMINDER DELAY field with a number between 1 and 180 days.

**PXRM*2*23:**
This build places updated VA-PROJECT ARCH VISN CONTRACT CARE PILOT ELIGIBILITY in the Reminder Exchange file. Updates to this reminder include a new Health Factor ARCH-SERVICE NEEDED THIS VISIT REFUSES. The updates also include a mandatory checkbox indicating that the patient has signed the consent form when the ARCH-SERVICE NEEDED THIS VISIT CONSENTS Health Factor is selected in the Reminder Dialog.
Patch 22 (PXRM*2*22) Changes

Patch PXRM*2*22 releases two new National Reminder Order Checks for placing Teratogenic Medications in CPRS. A pre-installation routine will identify any previously identified components and rename them correctly, and the patch installation will create or overwrite VA-named, national reminder components.

This patch also addresses two bug fixes in the Reminder Order Check setup. To address these fixes, the Reminder Order Check System had to be divided into two files:

- File 801 Reminder Order Check Items Group
  File 801 contains the grouping of Orderable Items. This file has also been modified to allow groups to include entries from the Drugs file, file #50, VA Generic file, file #50.6 and VA Drug Class file, file # 50.605.
- File 801.1 Reminder Order Check Rules.
  File 801.1 contains the Reminder Order Check Rules.

These changes will allow sites to modify the Active and Testing Fields for National Rules.

This patch also fixes a Mumps error when the select order checks prompt times out.

To support the two-file structures, the existing menu options have been renamed and two new options will be released with this patch: Reminder Order Check Rule Inquiry and Reminder Order Check Test.

Patch 21 (PXRM*2*21) Changes (Military Service Data Sharing (MSDS) project)

This patch is being released along with patches DG*5.3*797, EAS*1.0*92, IVM*2.0*141, DVB*4.0*62, in host file DG_53_P797.KID, to support technology and business changes that occur with the implementation of the Enrollment System Redesign (ESR) Military Service Data Sharing (MSDS) project. The MSDS project introduced an MSDS Broker that will be activated in ESR. The Broker will construct a definitive military service data set including data received from the VA/DoD Identity Repository (VADIR), the Beneficiary Identification and Records Locator System (BIRLS), and VistA. Once the MSDS Broker is activated, ESR becomes the authoritative source for Military Service Episode data. The verified data will be shared from ESR to all VistA sites of record for the Veteran. The ESR-verified Military Service Episode data cannot be edited by VistA except to add new episodes. An unlimited number of military service episodes per Veteran will now be supported.

Clinical Reminders Computed Findings

One aspect of the Military Service Data Sharing (MSDS) project increases the number of military service episodes from three to an unlimited number. It provides new APIs for Clinical Reminders to use to get this data. These APIs are used to update the computed findings, VA-SERVICE BRANCH and VA-SERVICE SEPARATION DATES, so they can get data for all episodes of service.

NOTE: VA-LAST SEPARATION DATE is being renamed to VA-LAST SEPARATION DATES, because now it will return all service separation dates instead of just the last one.

A new list type computed finding: VA-OEF/OIF SERVICE (LIST) is also included. It can be used to build lists of patients with OEF/OIF service.
Patch 18 (PXRM*2*18) Changes

The High Risk Mental Health Patient – National Reminder and Flag project includes a national reminder and reminder dialog that mental health professionals can use to follow up on patients with the “High Risk of Suicide” patient record flag, who missed their Mental Health appointments. The project also includes reports to facilitate follow-up on these patients by Suicide Prevention Coordinators and other Mental Health professionals.

Veterans Health Administration (VHA) mental health officials estimate that there are 1,000 suicides per year among Veterans receiving care within VHA and as many as 5,000 per year among all living Veterans. This request supports the Secretary’s Mental Health Strategic Plan that contains several initiatives pertaining to suicide prevention, including “Develop methods for tracking Veterans with risk factors for suicide and systems for appropriate referral of such patients to specialty mental health care.”

Major objectives of this project include:
1. Identifying those Veterans who are at risk for suicide (Sites define this locally in the Patient Record Flag.)
2. Preventing high risk, depressed patients from failing to get appropriate care if they miss appointments. The plan is to evaluate patients for depression so that appropriate referrals can be made, identify those Veterans with a history of suicide attempt or suicidal ideation who miss an appointment, notify the mental health professional of the missed appointment, and track efforts to reach this Veteran. If the Veteran is not reached after three attempts, a staff member may need to call other patient contacts or request a welfare check.

The purpose of this project is to release 1) two new Scheduling reports that identify no-show “high risk for suicide” patients that missed their MH appointments, 2) a new national reminder and reminder dialog that will be used by providers to document results of following up with a high risk for suicide patient that missed a MH appointment, and 3) provide a health summary type with MH-specific supporting information.

Phase 1: The first release of the High Risk Mental Health Patient Reminder and Flag (HRMHP) project includes five patches, which will be installed as a combined build. The second phase of this project will be released in a future build.

1. SD*5.3*578
   This Scheduling patch provides two new MH NO SHOW Scheduling Reports for use by Suicide Prevention Coordinators and other Mental Health professionals. The reports will support following up with High Risk for Suicide patients that missed a scheduled MH appointment.

2. DG*5.3*836
   This Registration – Patient Record Flag patch provides new interfaces used by the Scheduling and Reminder patches to determine the High Risk for Suicide flag status on a specified date.

3. PXRM*2*18
   This patch creates a national reminder to notify clinicians of a patient’s risk of suicide and creates a dialog that the clinicians can use to document follow-up with the high risk patients when they miss MH appointments.

   • HIGH RISK MH NO-SHOW FOLLOW-UP Reminder Definition
   • HIGH RISK MH NO-SHOW Follow-up Reminder Dialog
This Clinical Reminder patch supports the Scheduling patch by providing a national Reminder Location List of Mental Health stop codes used for scheduled appointments. Additionally, this patch includes miscellaneous clinical reminder maintenance changes. Details of all the Clinical Reminder changes can be found in the Release Notes.

4. **GMTS*2.7*99**
   This patch installs four Health Summary Components and two Health Summary Types, a single Health Summary Object, and a single TIU/Health Summary object.

5. **TIU*1*260**
   The Text Integration Utility patch contains a single Health Summary Object and a single new TIU Health Summary object based on the new VA-MH HIGH RISK PATIENT Health Summary Type from GMTS*2.7*99. The TIU/HS object will be used in the VA-MH HIGH RISK NO SHOW FOLLOW-UP Reminder Dialog distributed in PXRM*2*18.

*See the Clinical Reminders patch 18 Release Notes for specific details about enhancements and changes in patch 18 and related GMTS, OR, and TIU patches.*

**Patch 16 (PXRM*2*16) Changes**

The Clinical Reminders patch PXRM*2*16 and bundled patches (OR*3.0*280, PSJ*5.0*226) released new functionality that enables sites to create their own CPRS Order Checks using Clinical Reminder Definitions or Terms. Both Reminder Exchange and the Review Date Report have been enhanced to support the Clinical Reminder Order Check functionality.

This patch contains a new computed finding, VA-ACTIVE PATIENT RECORD FLAGS. This computed finding will allow sites to evaluate whether a patient has a specific active record flag on the date of evaluation.

Sites can create local order checks using the Clinical Reminder functionality. These Order Checks will occur at the time the user clicks on the accept button when placing an order in CPRS. This functionality is available with PXRM*2.0*16 and CPRS 28. The set-up of a Clinical Reminders Order Check consists of two parts:

- Creating a group of orderable items that the rules should be applied to.
- Creating the rules that will be applied to the orderable item when accepting an order in CPRS. It will be possible to have the same orderable item in multiple groups. Each rule assigned to the different groups will be evaluated when placing the orderable item in CPRS. The order check groups and the rule will be stored in the Reminder Order Check file, file #801.

*Note:* Sites should evaluate all requests to create a Clinical Reminder Order Check to determine the importance of adding it. The more reminders that are used in an order check, the more they could affect the performance of the order check system. This file stores a pointer to an entry in the Orderable Item file, file #101.43. The reminder Order Check file will not automatically be updated with changes to the Orderable Item file, such as inactivating an existing orderable item, or if an ancillary package adds an item to the Orderable Item file. The entries in Reminder Order Check file, file #801 need to be evaluated by the site anytime an update is done to the Orderable Item file, file #101.43. The site will be need to determine if it needs to remove an orderable item from an existing group or if it needs to add an orderable item to existing group.
A new menu Reminder Orderable Item Group Menu ...[ PXRM ORDERABLE ITEM GROUP MENU] has been added to the Reminder Managers Menu [PXRM MANAGERS MENU]

**Patch 17 (PXRM*2*17) Changes**

This project released a new national reminder and reminder dialog to be used by Polytrauma Specialty providers to identify potential OEF/OIF Polytrauma patients and mark the patient with a Polytrauma Marker (health factor) when appropriate.

The Polytrauma Marker project includes two patches:
PXRM*2*17 - Clinical Reminder patch with Polytrauma Marker reminder/dialog
USR*1*33 - ASU patch with API that checks to see if a user is a member of a specific User Class

This project was requested by the Office of Patient Care Services (PCS) to provide a means of improving care provided to Veterans and active duty patients suffering from blast-related polytrauma (multiple complex injuries). VHA has identified this as one of several initiatives that will support health care of Operation Iraqi Freedom and Operation Enduring Freedom (OIF/OEF) Veterans.

The Polytrauma Assessment reminder definition contains a new national reminder term which will be pre-defined with the new computed finding for the ASU User Class. Sites will be required to add the Computed Finding Parameter to the national reminder term. The parameter should specify the local ASU User Class that identifies specialty provider members that focus on Polytrauma and Rehabilitation services at the local facility.

The Polytrauma Assessment reminder uses a series of national Reminder Taxonomies to determine whether the patient has multiple diagnoses that identify the patient as a potential Polytrauma patient. The combination of the diagnoses found and the user’s ASU user class will determine whether the reminder is applicable to the patient.

If the reminder is applicable to the patient and the patient has not been previously assessed for Polytrauma, the reminder will be DUE and will appear on the cover sheet and in the reminder drawer on the CPRS notes tab.

The reminder will be resolved by the provider responding to reminder dialog responses that result in the assessment that the patient “is” or “is not” an OEF/OIF Polytrauma patient. The responses will cause Health Factors to be created that make the reminder no longer due.

If the CPRS user views Clinical Maintenance output for the Polytrauma Assessment reminder and the user is not a member of the ASU User Class, then a message will be included in the Patient Cohort section indicating that the ASU User Class was not found.

The new Polytrauma Assessment reminder dialog was created outside the OI Field Office and tested at three sites based on input from Rehabilitation Service stakeholders.

This reminder/dialog includes branching logic that will use the new national reminder term that is defined with the ASU user class used by the reminder definition. The branching logic will check to see if the CPRS user is a member of the ASU user class before continuing with the reminder dialog. If the CPRS
user is not a member of the ASU user class, then the reminder dialog will display text indicating the reminder is not applicable and the user is not the appropriate user to complete the reminder dialog.

Completing the reminder dialog will cause a progress note to be created and Health Factors will be populated in PCE. These health factors will be used by future reminder definition evaluation to indicate the reminder is resolved.
National Reminders

National reminders are clinical reminders and reminder dialogs that have gone through an approval process for national distribution. Some national reminders are related to statutory, regulatory, or Central Office mandates such as Hepatitis C and MST. Other national reminders are being developed under the guidance of the National Clinical Reminders Workgroup (NCRW).

Guideline-related reminders are developed for two reasons:

1. To provide reminders for sites that don’t have reminders in place for a specific guideline (e.g., HTN, HIV).
2. To provide a basic set of reminders to all sites to improve clinical care, and also allow roll-up data for measurement of guideline implementation and adherence (e.g., IHD, Mental Health).

Updates to National Reminders in Patch 18

1. Updated branching logic reminders for OEF/OIF screening:
   a. Fix the problem that patients who do not have the required LSSD entry are not having the items show as due when they have been done.
   b. Remove refusals and other exclusions from the branching logic – if not done, then show the item as open and allow the parent reminder to use the exclusions instead of also evaluating them in the branching logic. This makes all 7 of the branching logic reminders consistent.
2. Updated the URLs for MH screening.
3. Added '0' to the Within Category Rank for EF-NO BLAST/EXPLOSION INJURY and EF-NO BULLET INJURY in the reminder VA-EMBEDDED FRAGMENTS RISK EVALUATION.
4. Added occurrence count of 4 to AUD C in the alcohol screening reminder.
5. Fixed header/info text in AAA reminder.
6. Distributed H1N1 reminders and dialog via patch and distribute and inactivate.
7. Updated VA-ALCOHOL F/U POS AUDIT-C dialog to display the education and advice interventions without a box around both and also to have the results of an AUDIT-10 go into the progress note.
8. Added VA-TB/POSITIVE PPD.

Detailed descriptions:
1. Updated branching logic reminders
   VA-BL DEPRESSION SCREEN
   Removed RT.VA-ACTIVE DUTY
   Cohort: changed to due for all
   Resolution: changed to resolve for any entry that is not before the LSSD
   Changed the logic from
   \[ \text{MRD(VA-DEPRESSION SCREEN NEGATIVE,VA-DEPRESSION SCREEN POSITIVE)}\times\text{MRD(VA-LAST SERVICE SEPARATION DATE)} \]
   To
   \[ \text{MRD(VA-DEPRESSION SCREEN POSITIVE,VA-DEPRESSION SCREEN NEGATIVE)}\times\text{MRD(VA-LAST SERVICE SEPARATION DATE)} \]
VA-BL ALCOHOL SCREEN
   Removed RT.VA-ACTIVE DUTY
   Cohort: change to due for all
   Removed exclusions
   Resolution: changed to resolve for any entry that is not before the LSSD

VA-BL PTSD SCREEN
   Removed RT.VA-ACTIVE DUTY
   Cohort: change to due for all
   Removed exclusions
   Resolution: change to resolve for any entry that is not before the LSSD
   Add a '0' to the Within Category Rank for the health factors.

VA-BL OEF/OIF EMBEDDED FRAGMENTS
   VA-BL OEF/OIF FEVER
   VA-BL OEF/OIF GI SX
   VA-BL OEF/OIF SKIN SX
   Removed RT.VA-IRAQ/AFGHAN PERIOD OF SERVICE and substitute CF.VA-LAST SERVICE SEPARATION DATE
   Removed RT.VA-ACTIVE DUTY
   Cohort: change to due for all
   Resolution: change to resolve for any entry that is not before the LSSD

2. Updated URLs
   VA-ALCOHOL USE SCREEN (AUDIT-C)
   VA-DEPRESSION SCREENING
   VA-PTSD SCREENING

3. VA-EMBEDDED FRAGMENTS RISK EVALUATION: Added '0' to the Within Category Rank for EF-NO BLAST/EXPLOSION INJURY and EF-NO BULLET INJURY

4. VA-ALCOHOL USE SCREENING (AUDIT-C)
   a. Added occurrence count of 4 to AUD C in the alcohol screening reminder
   b. Updated the dialog by changing 'Optional open and optional complete (partial complete possible)' to 'Optional open and required complete or cancel before finish'.

5. Fixed grammatical error in VA-TEXT INFO SCREEN FOR AAA

6. Distributes reminders VA-INFLUENZA H1N1 IMMUNIZATION, VA-INFLUENZA H1N1 IMMUNIZATION HIGH RISK, and dialog VA-INFLUENZA H1N1 IMMUNIZATION (DIALOG). Distribute as INACTIVE.

7. Updated VA-ALCOHOL F/U POS AUDIT-C dialog to display the education and advice interventions without a box around both and also to have the results of an AUDIT-10 go into the progress note. Add an * to the word 'required' in 2 of the captions.

8. Added VA-TB/POSITIVE PPD. This updates the taxonomy VA-TB/POSITIVE PPD by adding the ICD diagnosis code 795.51
# Updates to National Reminders in Patch 12

The following Reminder components were updated and redistributed with PXRM*2*12:

<table>
<thead>
<tr>
<th>Component</th>
<th>Name</th>
<th>Change</th>
</tr>
</thead>
<tbody>
<tr>
<td>RD</td>
<td>VA-ALCOHOL AUDIT-C POSITIVE F/U EVAL</td>
<td>Added SUD; added text dialog element for local health summary object for prior AUDIT-C display; reversed order of feedback and advice; made nothing required</td>

NOTE: Several of these patches to the Clinical Reminders package have used the recently approved expedited patch process. These patches release new and updated National VHA reminders to the field, without any changes to routines, data dictionaries, or other package functions - they are “content-only” patches.
**Reminders Maintenance**

This section describes all the major components of the Clinical Reminders application. It describes the menus and options, and provides examples of how to use these to define reminders, create dialogs, and how to modify, troubleshoot, and maintain them for your site.

**Reminder Managers Menu**

This is a list of the options and menus on the Reminders Managers Menu.

**Options not on a menu**

The option PXRM DISABLE/ENABLE EVALUATION provides a manual disable/enable function. If for some reason, reminder evaluation needs to be disabled, it can be done through this option. This option should be given to a very limited number of people and can only be used by holders of the PXRM MANAGER key. When the issue that required disabling evaluation has been handled, reminder
evaluation can be enabled again using this same option. Note that this option can be used to enable evaluation even if it was not disabled using this option. For example, if reminder evaluation was automatically disabled for an index rebuild, this option could be used to enable evaluation even though the index is still rebuilding. If that is done, the MailMan messages will start being sent again.

Security Key

PXRM MANAGER
DESCRIPTION:
Assign this key to people who are responsible for managing Clinical Reminders.

Options/actions requiring key

PXRM DISABLE/ENABLE EVALUATION
(see above description)

PXRM FINDING USAGE REPORT  on the PXRM REMINDER REPORTS menu
- The field called Creator is populated when someone creates a reminder report template. This field will be used when someone accesses the template. The user accessing the template must either be the same user who created the template or must hold the PXRM MGR key to be able to access the option to edit the template. If the user is not the creator and does not hold the PXRM MANAGER key, they will not see the prompt to edit the template.

Patient List Management Option
Actions
- Create Patient List
  Secure List? prompt
   If the answer to this prompt is “YES,” the list becomes a private list, which means that the only people who can view the list are the creator, anyone who the creator has given view access, and anyone who holds the PXRM MANAGER KEY.

- ED (Edit Patient List) – if you are the creator of the list you can use this action to edit the name and type of list; if you hold the PXRM MANAGER key you can also edit the creator of the list.
- USR (View Users) – this action is applicable only to private lists. If you are the creator of the list or hold the PXRM MANAGER key you can use this action to give other users either view only or full access to the patient list. You can also remove a user’s access to the list.

Reminder Computed Finding Management

A computed finding is an M routine that takes a standard set of arguments. The computed finding must be entered into the REMINDER COMPUTED FINDING file #811.4 before it can be used as a finding in a reminder definition or term. When none of the standard finding types will work, a computed finding can be used.

The Clinical Reminders application provides a set of national computed findings. Sites can also create their own.

NOTE: Only programmers who have "@" access can actually write the routine and enter it into the REMINDER COMPUTED FINDINGS file. Once it is in the file, Reminders Managers can use the computed finding in reminder definitions.

Changes made by PXRM*2*26

The national computed finding VA-REMINDER DEFINITION evaluates a reminder definition. If it is used recursively (evaluating the same definition that is calling it), it will generate framestack errors. This can wreak havoc with production systems. Remedy ticket #761925. Code was added to prevent this. Also, a check for recursion was added to the Integrity Checker.

The print name of VA-REMINDER DEFINITION was changed from VA-Reminder Definition Computed Finding to VA-Reminder Definition. The variable TEXT was not set before, but is now set to "Reminder: "_NAME, where NAME is the .01 of the reminder being evaluated. This means that the name of the reminder definition that was evaluated will be displayed in the clinical maintenance output.

The description for VA-FILEMAN DATE was updated to make it clear that the global reminder dates PXRMDOB, PXRMDOD, and PXRMLAD can also be used with this computed finding.

The computed finding inquiry was not displaying the Type; Type was added.

When a computed finding was selected to be used as a finding in a definition or term, the description of the computed finding was displayed on the screen to help the user set it up properly. If Type was not included in the description, then it was not displayed. The computed finding help was upgraded to include Type, Class, and Description, and is now displayed with the Browser instead of just written to the screen.

In the past we have had problems with updated national computed findings being overwritten by outdated versions that were installed via Reminder Exchange. To prevent further occurrences, Reminder Exchange was modified so it will not install national computed findings. From this point on, national computed findings will only be distributed via a KIDS build.

EXPECTED SIGNER and EXPECTED COSIGNER were added as CSUBs to the VA-PROGRESS NOTE computed finding. The description was updated to include these.
When using the special Reminder Location List VA-ALL LOCATIONS in the computed finding VA-APPOINTMENTS FOR A PATIENT, a message was being erroneously displayed (Remedy ticket #916079):

`^TMP(NODE,$J,1,0)=Warning Reminder Location List VA-ALL LOCATIONS
^TMP(NODE,$J,2,0)=does not contain or expand to contain any hospital locations!`

This was corrected.

### Steps to Create a Computed finding

NOTE: The person who performs the step is listed in parentheses.

1. **Write an M routine (developer).**

For a single occurrence computed finding, the routine takes the following arguments: (DFN, TEST, DATE, DATA, TEXT). DFN is the patient ien and will be set when the computed finding routine is called. The following variables should be set by the computed finding routine.

   - **TEST** is the logical value of the finding, set to 1 for true and 0 for false. A value for TEST must always be returned.
   - **DATE** is the date of the finding in FileMan format. Set it to null if the finding is false

DATA is a value associated with the finding that can be used by the CONDITION field; when the Condition is evaluated V=DATA. Additional values that can also be used in the CONDITION can be passed back in DATA. This is done using subscripts, i.e., DATA(“COLOR”)="RED” and the CONDITION could test for color with a statement like I V("COLOR")="BLUE”. The choice of what data is passed back and the associated subscripts are completely up to the programmer, however they should be well documented so the person using the computed finding knows what is available. See the DESCRIPTION field below for information on how to document your computed finding. Setting the DATA array is optional, but it must be set if a CONDITION is going to be used with the computed finding.

TEXT is text to be displayed in the Clinical Maintenance output. Setting this is optional.
Note: Now that multiple occurrence computed findings are available, creation of new single occurrence computed finding is generally discouraged because single occurrences are less flexible and less powerful.

For a multiple occurrence computed finding, the routine takes the following arguments:
(DFN, NGET,BDT,EDT, NFOUND,TEST,DATE,DATA,TEXT).

The following variables will be set when the computed finding routine is called:
- DFN is the patient ien.
- NGET is the number of findings to search for.
- BDT is the beginning date and time for the finding search.
- EDT is the ending date and time for the finding search.

The following variables should be set by the computed finding routine:

NFOUND is the number of findings found in the date range, it should never be larger than NGET. If there are no true findings then NFOUND should be set to 0.

Since this form of the computed finding returns multiple occurrences, each of the following variables is an array with NFOUND entries. Entry number 1 should be the most recent in the date range, entry number 2 the second most recent, and so on up to NFOUND entries. If NGET is negative, then the date ordering should be reversed with entry 1 the oldest in the date range, entry 2 the second oldest, and so on. If there are no true findings, then NFOUND should be 0. NFOUND must have a value when the computed finding routine returns. For the Nth true occurrence, set the following values:

- TEST(N) is the logical value of the finding for occurrence N; this is set to 1 for each occurrence that is found. (Required)
- DATE(N) is the date of the finding in FileMan format for occurrence N. (Required)
- DATA is an array of values that can be used by the CONDITION field. For the N’th occurrence set DATA(N,”VALUE”)=VALUE. You can also pass back other data using subscripts just as for a single occurrence computed finding, the only difference being the occurrence subscript comes first. For example, DATA(N,”COLOR”)=”RED”.
- TEXT(N) is text to be displayed in the Clinical Maintenance output for occurrence N. (Optional)

There is no need to set the unsubscripted values of TEST and DATE in a multi-occurrence computed finding.

In most cases it makes sense to create any new computed findings as multi-occurrence computed findings. They have more flexibility than single occurrence computed findings and can operate more efficiently. This is especially true with respect to date range searches. The multi-occurrence computed finding is passed the beginning and ending dates as parameters, so it can return results from the specified date range. The original single occurrence computed finding has no provision for passing the beginning and ending dates, so it would just return the most recent occurrence. The computed finding driver must then check the date returned to determine if it is in the date range. If it is not, then there is no way to go back and look for an older result that might be in the date range.
For a *list* computed finding, the routine takes the following arguments:

- (NGET, BDT, EDT, PLIST, PARAM)
- NGET, BDT, and EDT have the same meaning as above. (See below for a discussion of the last argument.) The routine should return the list in a ^TMP global as follows:

  - ^TMP($J, PLIST, DFN, N) = DAS^DATE^FILENAME^ITEM^VALUE

- N is a number specifying the number of the occurrence. N=1 is the most recent occurrence, N=2 the second most recent occurrence, and so on. N should never exceed NGET.
- DAS is the DA string. See the Clinical Reminder Index Technical Manual for an explanation of what a DA string is.

  **NOTE:** DAS is optional for a list computed finding, but if it's not set, a NULL should be used; i.e., ^TMP($J, PLIST, DFN, N) = ^DATE^FILENAME^ITEM^VALUE

- DATE is the date of the finding.
- FILENUM is the file number where the result was found.
- ITEM is the internal entry number of the item that was found.
- VALUE is the default value, if there is not one then it should be null.

If you want to use a Condition with the computed finding, then you should return the values as follows:

  ^TMP($J, PLIST, DFN, N, SUB) = DATA(N, "SUB")

At a minimum, one of the subscripts must be “VALUE”; i.e., DATA(N, “VALUE”); then in the Condition you can use either V or V(“VALUE”), because V is set equal to V(“VALUE”). If you create other subscripts, you can use them in the Condition. For example:

- ^TMP($J, PLIST, DFN, 1, ”VALUE”) = 5
- ^TMP($J, PLIST, DFN, 1, ”RATE”) = 5
- ^TMP($J, PLIST, DFN, 1, ”COLOR”) = ”RED”

would mean in the Condition you could use V, V(“VALUE”), V(“RATE”) or V(“COLOR”).

The field **COMPUTED FINDING PARAMETER** can be used to pass a parameter into the computed finding routine. For single and multiple occurrence computed findings, the value is passed in TEST; for list computed findings, it is passed as PARAM. The COMPUTED FINDING PARAMETER is defined as free-text field with a length of 245 characters so it can be used to pass more than one parameter. If you pass more than one parameter, you should not use “\^” as the piece separator, because it will not be properly transported in Reminder Exchange. When this feature is used, it will need to be documented, so that users of the computed findings will know how to properly define the contents of the COMPUTED FINDING PARAMETER field.

Great care should be taken whenever you create a computed finding. If it is poorly written, it could affect system performance, generate errors, and produce incorrect or misleading reminder evaluation results.

Hint: make sure that you “new” all the variables you use, to avoid strange side effects.

2. **Enter your computed finding into the Reminders package (developer).**

Use the option Reminder Computed Finding Edit (CFE) on the Computed Findings menu to enter/register your computed finding, which makes an entry in the REMINDER COMPUTED FINDINGS file (#811.4).

File #811.4 contains a combination of nationally distributed and local entries. Nationally distributed entry names are prefixed with VA-. Local entry names can’t start with VA-.
Complete each of the following fields:

NAME (.01 field) - this is the name of the computed finding. When a computed finding is added as a finding to a reminder definition, it is done using NAME. For example, type CF.VA-BMI to add the exported VA-BMI computed finding to your reminder definition.

ROUTINE (.02 field) - this is the name of the MUMPS routine.

ENTRY POINT (.03 field) - this is the entry point in the MUMPS routine (the line tag at which that finding begins).

PRINT NAME (.04 field) - this will be displayed on the Clinical Maintenance component as the name of the computed finding. If it is blank, NAME will be used.

TYPE (5 field) – this is a set of codes that specifies what type of computed finding this is. “S” stands for single occurrence, “M” for multiple occurrence, and “L” for list. If it is blank, single will be assumed.

DESCRIPTION – This is a word-processing field that is used to document the computed finding. It is very important to include this field so that the person who is using the computed finding knows how to properly use it. During the definition editing process if a computed finding is selected as a finding the DESCRIPTION will be displayed to the user so the documentation for the computed finding will be right in front of them as they setup the computed finding.

The remaining fields are optional.

Example

Select Reminder Computed Finding Management Option: cfe Reminder Computed Finding Edit

Select Reminder Computed Finding: AJEY TEST COMPUTED FINDING ...OK? Yes// <Enter> (Yes)

NAME: AJEY TEST COMPUTED FINDING Replace <Enter>
ROUTINE: PXRMZC1
ENTRY POINT: TEST
PRINT NAME: Test Computed Finding
TYPE: ?
Choose from:
M MULTIPLE
L LIST
S SINGLE
DESCRIPTION:
1>
CLASS: LOCAL/
SPONSOR:
REVIEW DATE:

Example: Computed finding for determining if a patient is an inpatient
If you want it to be true, set TEST to 1.
Set the DATE="" when TEST=0 and set DATE to the date of the finding when TEST=1
Set VALUE to a value that can be tested against in the CONDITION field.
TEXT just goes back as additional info in the Clinical Maintenance view.
So, if you made one that was testing for whether your patient was an inpatient, it might look like this:

```plaintext
INP(DFN,TEST,DATE,VALUE,TEXT) ;
N VAIN
D INP^VADPT ;IA #10061
I +$P(VAIN(7),U,1) S TEST=1,DATE=$P(VAIN(7),U,1)
E S TEST=0,DATE=""

In this example we are not going to use TEXT or VALUE, so they are set to null.

3. (Reminder Manager) Place the finding into your reminder.

Now that the finding is created and entered/registered, you may use it just like any other finding would be used. The prefix for selecting a computed finding is CF. When a computed finding is selected its description will be displayed and this will provide information on how to use the selected computed finding. This is an example of adding a computed finding to a reminder definition.

```plaintext
Select FINDING: CF.VA-DATE FOR AGE
Searching for a REMINDER COMPUTED FINDING, (pointed-to by FINDING ITEM)
VA-DATE FOR AGE NATIONAL

...OK? Yes// Y (Yes)
Computed Finding Description:
This computed finding returns the date on which the patient will reach the age (in years) specified by the value of the computed finding parameter. Both the default value and date of the finding will be the date in FileMan format when the patient reaches the specified age.

Fractional ages like 59.5 are not allowed and the fractional part will be ignored.

Detailed Descriptions

VA-ACTIVE PATIENT RECORD FLAGS
This multiple occurrence computed finding will return active patient record flags. The Computed Finding Parameter is used to precisely specify what flags to search for. There are three parameters that can be used: C for category, T for type, and F for a specific flag.

The possible values are:

- Category - N (national), L (local)
- Type - B (behavioral), C (clinical), O (other), and R (research)
- Flag - exact name of the flag

Use the "^" character to include more than one parameter in the search specification.

Some examples:
C:L - would search for local flags
C:N^T:B - would search for national flags whose type is behavioral
F:DRINKING PROBLEM - would search for the flag DRINKING PROBLEM
T:C^F:INFECTIOUS DISEASE - would search for the flag INFECTIOUS DISEASE whose type is clinical

Only active flags that meet all the specified criteria will be returned. If no search parameters are specified then no flags will be returned.

The date associated with a flag is the assigned date.

The following "CSUB" data is returned for each flag that is found:

APPRVBY - approved by
ASSIGNDT - assigned date/time
CATEGORY - category
DATE - assigned date/time
FLAG - flag name
FLAGTYPE - flag type
ORIGSITE - originating site
OWNER - owner site
REVIEWDT - review date/time
TIULINK - pointer to the TIU note (only applies if the flag is linked to a TIU note)
TIUTITLE - the note title (only applies if the flag is linked to a TIU note)

VA-ADMISSIONS FOR A DATE RANGE
This list type computed finding can be used to build a list of patients who were admitted in the specified date range. A Reminder Location List can be used to restrict the selection of patients to only the ward locations included in the location list. To do this, enter the exact .01 name of a Reminder Location List into the COMPUTED FINDING PARAMETER field. If a Reminder Location List is not used then all ward locations will be included.

The CONDITION field may also be used to select entries by any of the following CSUB subscripts:

V or V("VALUE") = the ward to which the patient was admitted in the format of 9;3EAST (IEN;Ward Name)

V("INSTITUTION") = the name of the INSTITUTION (file #4) entry with which the ward is associated in the format 5000;ELY;660GC (IEN;Institution Name;Station Number)

V("TYPE_OF_MVMT") = the type of movement entry from file 405.1 (e.g., REGULAR, OPT-NSC, OPT-SC, etc.)

VA-AGE
Print Name: VA-Patient Age
Class: NATIONAL
Sponsor: Review Date:

Description:
This is a single occurrence computed finding that returns the patient's age in years. It can be used as the value in the Condition. For example: I V>50.

If the patient is deceased the age will be their age on the date of death and V("DECEASED")=1.

Entry Point: AGE Routine: PXRMPDEM
VA-AGE BIRTH SEX LIST
ROUTINE: PXRMASL
ENTRY POINT: CFAGESL       PRINT NAME: VA-Age and Birth Sex List
TYPE: LIST                  CF PARAMETER REQUIRED: YES
DESCRIPTION:
This list type computed finding builds a list of all patients in the inclusive age range defined by a minimum age and a maximum age. Optionally, birth sex can be used as an additional filter.

The Computed Finding Parameter is used to specify the search criteria in the format: minimum age^maximum age^sex. Age is written as a number followed by a unit. The units are: D=days, W=weeks, M=months, or Y=years. If the unit is not specified it defaults to years. Sex can be F=female, M=male, or null. If sex is null then both female and male patients who fall in the age range will be included on the list.

Here are some examples:
- 30Y^65Y  - all patients between the ages of 30 and 65 years
- 40Y^65Y^F  - all female patients between the ages of 40 and 65 years
- 66Y^66Y^M  - all male patients whose age is 66 years

If these parameters are not correctly specified no patients will be on the list. Minimum age and maximum age cannot be null and maximum age must be greater than or equal to minimum age.

Note that Beginning Date/Time, Ending Date/Time, and Occurrence Count are not relevant for this computed finding.

CLASS: NATIONAL

VA-AGENT ORANGE EXPOSURE
This computed finding will be true if the patient has an agent orange exposure registration date in the date range specified by Beginning Date/Time and Ending Date/Time.

Subscripts that can be used in a Condition are: "LOCATION"

The default value is "LOCATION".

VA-ALLERGY
Print Name: VA-Allergy
Class: NATIONAL
Sponsor:
Review Date:

Description:
Identifies any allergies that contain either the ingredient or drug class that you specify via the Computed Finding Parameter. Ingredients will be prefixed with IN: while DR: is used for drug classes. You may also use the * as a wildcard on the end of your selection. For example, to search for the ingredient aspirin you would enter IN:ASPIRIN. For drug class MS101 you would enter DR:MS101. For all ingredients
beginning with "ampi" you would type IN:AMPI*. For all MS1 related drug classes you'd enter DR:MS1*.

Note: This computed finding does not support date reversal.

Entry Point: ARTCL    Routine: PXRMART

Appointment Computed Findings

These appointment computed findings allow more detailed or specific appointment information to be used in cohort or resolution logic in reminder definitions. Use the COMPUTED FINDING PARAMETER in the findings editor to filter the results. See the Descriptions and examples that follow, for instructions on how to use these computed findings.

VA-APPOINTMENTS FOR A PATIENT

This multiple occurrence computed finding returns a list of appointments for a patient in the specified date range from the Scheduling Package.

The Computed Finding Parameter can be used to specify which appointment data fields should be returned from the Scheduling package and filter the results returned based on location and status. The Computed Finding Parameter entry uses FLDS: to specify appointment data fields, STATUS: to filter specific statuses, and LL: to specify a Reminder Location List to filter locations.

FLDS, STATUS, and LL are all optional and can be defined in any order in the computed finding parameter field.
Some examples of how to use FLDS, STATUS and/or LL:
- FLDS:1,2,16^STATUS:R^LL:DIABETIC LOCATIONS
- STATUS:CP,CC^FLDS:25
- LL:DIABETIC LOCATION

FLDS parameter information:
The appointment data fields are specified as follows:
FLDS:F1,F2,... where F1,F2,... are any of the possible ID values listed in the Available Appointment Data Fields table below.
The F1,F2,... ID values specify what data associated with the appointment will display in the clinical maintenance output. If no FLDS is specified, the default display fields will be 1,2 for APPOINTMENT DATE/TIME and CLINIC.

Additionally, each F1,F2,... specified will be returned as CSUB data that can also be used in the computed finding’s CONDITION field. The CONDITION can be used to further screen the filtered appointments, returned by Scheduling, by setting the USE STATUS/CONDIN SEARCH field to YES.

For example, if you only want appointments that were checked out, use FLDS: 1,2,11 to get the APPOINTMENT DATE/TIME, CLINIC, and CHECK-OUT DATE/TIME for display purposes. The FLDS:1,2,11 will return the CSUB data "APPOINTMENT DATE/TIME", "CLINIC" and "CHECK-OUT DATE/TIME".

CSUB values are used in the CONDITION field to do a comparison to numeric or string values. Using +V causes the CSUB data to be interpreted as as numeric. Strings that cannot be converted to a number are set to zero. For example, a CONDITION such as I +V("CHECK-OUT DATE/TIME")>0 would be true if the appointment had a check-out date/time.

</tr>
<tr>
<td>32</td>
<td>CONSULT LINK</td>
</tr>
</tbody>
</table>

STATUS information:
STATUS: is used to set a filter on the appointment status; only those appointments with a status that matches the STATUS: values list will be returned. The possible values that the Scheduling API allows are:

<table>
<thead>
<tr>
<th>VALUE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>R</td>
<td>SCHEDULED/KEPT</td>
</tr>
<tr>
<td>I</td>
<td>INPATIENT</td>
</tr>
<tr>
<td>NS</td>
<td>NO-SHOW</td>
</tr>
<tr>
<td>NSR</td>
<td>NO-SHOW, RESCHEDULED</td>
</tr>
<tr>
<td>CP</td>
<td>CANCELLED BY PATIENT</td>
</tr>
<tr>
<td>CPR</td>
<td>CANCELLED BY PATIENT, RESCHEDULED</td>

<td>CANCELLED BY CLINIC</td>
</tr>
<tr>
<td>CCR</td>
<td>CANCELLED BY CLINIC, RESCHEDULED</td>
</tr>
<tr>
<td>NT</td>
<td>NO ACTION TAKEN</td>
</tr>
</tbody>
</table>

If STATUS is not specified the default is R,I.

The APPOINTMENT STATUS returned by the API is a summarized list which does not include detailed statuses such as Future, Checked-In, or Checked Out. These statuses are summarized as
SCHEDULED/KEPT. As a result, a CONDITION may be required to make sure you are getting the correct results. For example, if you are looking for an appointment that was kept you would set STATUS:R combined with a CONDITION of I (+V("OUTPATIENT ENCOUNTER IEN")>0)!(+V("CHECK-OUT DATE/TIME")>0) with USE STATUS/COND IN SEARCH set to YES.

LL information:
LL: Reminder Location List specifies a list of locations so that only appointments for those locations will be returned. If LL is not specified, then appointments for all locations will be returned.

**VA-ASU USER CLASS**
Print Name: VA-ASU User Class
Class: NATIONAL
Sponsor:  
Review Date:

Description:
This multi-occurrence computed finding returns a list of the ASU User Classes that the user belongs to. The user is the person who is running the reminder evaluation or processing a reminder dialog.

When a user is assigned to an ASU User Class, there can be an Activation Date and an Expiration Date. For the purpose of this computed finding, the date of the finding will be the Activation Date. In those cases when there is no Activation Date, 00/00/0000 will be displayed as the date of the finding. If a Beginning Date/Time and Ending Date/Time are used with the finding, then the period defined by the
Activation Date and Expiration Date must overlap the period defined by the Beginning Date/Time and the Ending Date/Time in order for the finding to be true. When the Activation Date is missing, a 0 will be used in its place for determining the overlap. When the Expiration Date is missing, the evaluation date will be used in its place for determining the overlap.

The Computed Finding Parameter can be used to specify either the internal entry number or the exact name of an ASU User Class. If this option is used, then each User Class the user is a member of is checked to see if it is either the specified User Class or a child of the specified User Class. Only the User Classes that pass this test will remain on the list of the user's User Classes. For example, if the user is a member of the user class ATTENDING PHYSICIAN, which is a child of the user class PHYSICIAN, and the Computed Finding Parameter is set to "PHYSICIAN," then ATTENDING PHYSICIAN will remain on the list. If the Computed Finding Parameter was set to CARDIOLOGIST, then ATTENDING PHYSICIAN would be removed since it is not a child of CARDIOLOGIST.

If you want to specify the user class as PHYSICIAN, in the computed finding parameter field, type the following: COMPUTED FINDING PARAMETER: PHYSICIAN

This computed finding uses date ranges like drug findings do, so if the user was an active member of the class anytime during the date range, the computed finding will be true. If you want to know if the user is active as of today, then use T for the beginning and ending date/time.

Entry Point: CLASS Routine: PXRMASU

VA-BIRTH DATE BIRTH SEX LIST
ROUTINE: PXRMASL
ENTRY POINT: CFBDAYSL
PRINT NAME: VA-Birth Date Birth Sex List
TYPE: LIST
CF PARAMETER REQUIRED: YES
DESCRIPTION:
This list type computed finding builds a list of all patients in the inclusive age defined by a minimum birth date and a maximum birth date.

Optionally, birth sex can used as an additional filter.

The Computed Finding Parameter is used to specify the search criteria in the format: minimum birth date^maximum birth date^sex. The dates can be entered in any of the date formats that can be used in Clinical Reminders. Sex can be F=female, M=male, or null. If sex is null then both female and male patients whose birth date falls in the range will be included on the list.

Here are some examples:
- 10/01/1940^Oct 1, 1965 - all patients born between October 1, 1940 and October 1, 1965.
- Jun 1, 1969^Jun 1 1969^M - all male patients born on June 1, 1969.

If these parameters are not correctly specified no patients will be on the list. Minimum birth date and maximum birth date cannot be null and maximum birth date must be greater than or equal to minimum birth date.
Note that Beginning Date/Time, Ending Date/Time, and Occurrence Count are not relevant for this computed finding.

CLASS: NATIONAL

VA-BMI
The VA-BMI computed finding calculates the patient's body mass index. The value returned, which can be used in the CONDITION field of the findings, is the body mass index.

Note that date range searching is applied only to the weight and that the date of the finding is the date of the weight measurement used in the BMI calculation. The height used in the calculation will be the height measurement that occurred closest to the date of the weight measurement. This may be before or after the weight measurement.

An example of using the VA-BMI computed finding:
1) Create a finding in a reminder that is the VA-BMI computed finding;
2) Add logic in the CONDITION field to check for a particular BMI value: "I V>25";

Example: Changing the Occurrence count in a Reminder Definition using VA-BMI

</tr>
</tbody>
</table>

The default is to use the Mosteller formula. Unless there is a reason to use one of the other formulas, the recommendation is to use the default, because it is faster to calculate and the numerical results are very close to those of the other formulas.

### Formulas for Body Surface Area Calculator

#### The Mosteller formula

$BSA (m^2) = \left( \frac{\text{Height(cm) x Weight(kg)}}{3600} \right)^{\frac{1}{2}}$  

or in inches and pounds:  

$BSA (m^2) = \left( \frac{\text{Height(in) x Weight(lbs)}}{3131} \right)^{\frac{1}{2}}$

#### The DuBois and DuBois² formula

$BSA (m^2) = 0.20247 x \text{Height(m)}^{0.725} x \text{Weight(kg)}^{0.425}$

A variation of DuBois and DuBois that gives virtually identical results is:

$BSA (m^2) = 0.007184 x \text{Height(cm)}^{0.725} x \text{Weight(kg)}^{0.425}$

#### The Haycock formula

$BSA (m^2) = 0.024265 x \text{Height(cm)}^{0.3964} x \text{Weight(kg)}^{0.5378}$

#### The Gehan and George formula

$BSA (m^2) = 0.0235 x \text{Height(cm)}^{0.42246} x \text{Weight(kg)}^{0.51456}$

#### The Boyd formula

$BSA (m^2) = 0.0003207 x \text{Height(cm)}^{0.3} x \text{Weight(grams)}^{(0.7285 - (0.0188 x \text{LOG(grams)})})$

### References

Note that the changes to VA-BMI (only applying the date range criteria to the weight) also apply to the VA-BSA computed finding, because it uses the same routine to obtain matched weight and height measurements.

**VA-CASCADE INDEX**

Review Date:

Description:

This computed finding can return multiple patient cascade(s). The computed finding parameter field is mandatory. The parameter structure is:

**NAME:STATUS**

NAME is the type of cascade to search for – at this time only BREAST CARE is available for use in this field:

STATUS is either OPEN or "". OPEN only returns cascade with a status of open. "" Returns both OPEN and CLOSED cascades.

If searching for an open cascade the computed finding will return only one cascade. If searching for all cascade the computed finding will return cascade when the START DATE is between the passed in start and stop date.

The data output is: DATA("STATUS")=STATUS (OPEN or CLOSED) DATA("NAME")=CASCADE NAME DATA("DIALOG")=1

The DIALOG parameter is used to let the Reminder Dialog Branching Logic build the dialog element/group display text from the TEXT node from the computed finding output.

Entry Point: EPISODE    Routine: PXRMCEOC
**VA-COMBAT SERVICE**
This computed finding will be true if combat service is found in the date range the date range specified by Beginning Date/Time and Ending Date/Time.

Subscripts that can be used in a Condition are:
"LOCATION"

The default value is "LOCATION".

Entry Point: COMBAT    Routine: PXRMMSER

**VA-COMBAT VET ELIGIBILITY**
Print Name: VA-Combat Vet Eligibility
Class: NATIONAL
Sponsor:
Review Date:

Description:
This computed finding will be true if the patient qualifies as a combat vet.

The possible values that can be used in a Condition are: "Eligible", "Expired", and "Not eligible". An example is:

I V="Not eligible"

If the patient was eligible on the evaluation date then the Value for use in a Condition will be "Eligible". If the patient is not eligible and the evaluation date is greater than the eligibility end date then the Value is "Expired", otherwise the value is "Not eligible".

Entry Point: CVELIG    Routine: PXRMMSER

**VA-CURRENT INPATIENTS**
Print Name: VA-Current Inpatients
Class: NATIONAL
Sponsor:
Review Date:

Description:
This list type computed finding can be used to build a list of all current inpatients. Note that current refers to the actual calendar date so for this computed finding date ranges are irrelevant. A Reminder Location List can be used to restrict the selection of patients to only the ward locations included in the location list. To do this, enter the exact .01 name of a Reminder Location List into the COMPUTED FINDING PARAMETER field. If a Reminder Location List is not used, then all ward locations will be included.

The CONDITION field may also be used to select entries by any of the following CSUB subscripts:

V or V("VALUE") = the ward to which the patient is currently admitted in the format of 9;3EAST (IEN;Ward Name)
V("INSTITUTION") = the name of the INSTITUTION (file #4) entry with which the ward is associated in the format 5000;ELY;660GC (IEN;Institution Name;Station Number)

V("ADMIT DATE") = the date of admission for the patient in the format 3010815.114255^AUG 15,2001@11:42:55 (Internal^External)

Entry Point: CURR Routine: PXRMINPL

**VA-DATE FOR AGE**
Print Name: VA-Date for Age
Class: NATIONAL
Sponsor:
Review Date:

Description:
This computed finding returns the date on which the patient will reach the age (in years) specified by the value of the computed finding parameter. Both the default value and date of the finding will be the date in FileMan format when the patient reaches the specified age.

Fractional ages like 59.5 are not allowed and the fractional part will be ignored.

Entry Point: DFA Routine: PXRMPDEM

**VA-DATE OF BIRTH**
Print Name: VA-Patient's Date of Birth
Class: NATIONAL
Sponsor:
Review Date:

Description:
This is a single occurrence computed finding that returns the patient's date of birth as a FileMan date. It can be used as the value in the Condition. For example: I V>2850302. The date of the finding is the date of birth so that date range searches can be used to find patients who were born in a certain time frame.

Entry Point: DOB Routine: PXRMPDEM

**VA-DATE OF DEATH**
Print Name: VA-Patient's Date of Death
Class: NATIONAL
Sponsor:
Review Date:

Description:
This is a single occurrence computed finding that returns the patient's date of death, if it exists, as a FileMan date. It can be used as the value in the Condition. For example: I V>2330304. The date of the finding is the date of death so that date range searches can be used to find patients who died in a certain time frame.

Entry Point: DOD Routine: PXRMPDEM
VA-DISCHARGES FOR A DATE RANGE
This list type computed finding can be used to build a list of patients who have been discharged in the specified date range. A Reminder Location List can be used to restrict the selection of patients to only the ward locations included in the location list. To do this, enter the exact .01 name of a Reminder Location List into the COMPUTED FINDING PARAMETER field. If a Reminder Location List is not used then all ward locations will be included.

The CONDITION field may also be used to select entries by any of the following CSUB subscripts:

\[ V \text{ or } V("VALUE") = \text{the ward from which the patient was discharged} \]
\[ \text{ in the format of } 9;3EAST \text{ (IEN;Ward Name)} \]

\[ V("INSTITUTION") = \text{the name of the INSTITUTION (file #4) entry} \]
\[ \text{with which the ward is associated in the format} \]
\[ 5000;ELY;660GC \text{ (IEN;Institution Name;Station Number)} \]

\[ V("TYPE_OF_MVMT") = \text{the type of movement entry from file 405.1} \]
\[ \text{(e.g., REGULAR, OPT-NSC, OPT-SC, etc.)} \]

VA-EMPLOYEE
DESCRIPTION: This computed finding will be true if the patient was an employee during the date range specified by the Beginning Date/Time and Ending Date/Time.

The following algorithm is used to determine if the patient was an employee:

1. A lookup based on the patient’s SSN is made in the New Person file. If there is no match, the computed finding is false.
2. If there is a match, a check is made to see if the patient’s New Person file entry has a pointer to the PAID file. If there is no pointer, the computed finding is false.
3. If there is a pointer, then Date Entered is compared with Ending Date/Time. If it is greater, the computing finding is false.
4. Next, a check is made to see if there is a Termination Date. If there is a Termination Date and it is prior to the Beginning Date/Time, the computed finding is false.
5. If steps one through four are passed, the computed finding is true.

VA-ETHNICITY
Print Name: VA-Patient's Ethnicity
Class: NATIONAL
Sponsor:
Review Date:
Description:
This multiple occurrence computed finding will return the patient's ethnicity values from the Patient file. If none are recorded then the computed finding will be false. This computed finding does not support date reversal.

The value of the computed finding that can be used in the Condition is the patient's ethnicity.

Entry Point: ETHNY Routine: PXRMPDEM
VA-FILEMAN DATE
Print Name: VA-FileMan Date
Class: NATIONAL
Sponsor:
Review Date:

Description:
The purpose of this computed finding is to allow the creation of a finding that has a specific date to be used for comparison purposes in a function finding date function.

This computed finding takes any acceptable FileMan date, via the COMPUTED FINDING PARAMETER, and sets the date of the finding and its value to that date.

See the FileMan Getting Started Manual to learn about acceptable FileMan date/time formats and abbreviations. Additionally, you may use the abbreviations T-NY or NOW-NY, where N is an integer and Y stands for years.

For example, setting the COMPUTED FINDING PARAMETER to T-3M would give the finding a date and value of the evaluation date minus three months.

Entry Point: FMDATE Routine: PXRMDATE

VA-IS INPATIENT
Print Name: VA-Is Inpatient
Class: NATIONAL
Sponsor:
Review Date:

Description:
This computed finding will be true if the patient was/is an inpatient on the evaluation date. The following "CSUB" values will be available:

- ADMISSION DATE/TIME (FileMan format)
- ADMISSION TYPE
- ATTENDING PHYSICIAN
- DATE (FileMan format)
- PRIMARY PROVIDER
- TREATING SPECIALITY
- WARD LOCATION

Entry Point: INP Routine: PXRMPDEM
Example:

**VA-OEF SERVICE**

This multi-occurrence computed finding will search for periods of OEF service in the date range specified by Beginning Date/Time and Ending Date/Time.

Subscripts that can be used in a Condition are:
"LOCATION"

The default value is "LOCATION".

Entry Point: OEF Routine: PXRMMSER

Clinical Reminders Manager’s Manual 47 May 2021
VA-OIF SERVICE
Print Name: VA-OIF Service
Class: NATIONAL
Sponsor:
Review Date:

Description:
This multi-occurrence computed finding will search for periods of OIF service in the date range specified by Beginning Date/Time and Ending Date/Time.

Subscripts that can be used in a Condition are:
"LOCATION"

The default value is "LOCATION".

Entry Point: OIF       Routine: PXRMMSER

VA-OEF/OIF SERVICE (LIST)
Print Name: VA-OEF/OIF Service List Patient List
Class: NATIONAL
Sponsor:
Review Date:

Description:
This list type computed finding builds a list of patients who have been deployed in Operation Enduring Freedom (OEF) or Operation Iraqi Freedom (OIF). If the location was either OEF or OIF, but cannot be Disclosed or determined, then it is listed as unknown (UNK).

Date range searching is done by looking for an overlap in the period defined by Beginning Date/Time (BDT) and Ending Date/Time (EDT), with the period defined by OEF/OIF From and To Dates. In order for a patient to be included on the list, there must be an overlap of these two time periods. In other words, if patients had service at any time in the date range specified by BDT and EDT, they will be included.

The Computed Finding Parameter can be used to include only patients who had service at a specific location. The locations can be OEF, OIF, or ANY. The value ANY, which is the default, will include all locations. Each location is separated by the "^" character. For example, to include patients who had OEF service the Computed Finding Parameter is: OEF
To include patients who had either OEF or OIF service, the Computed Finding Parameter is: OEF^OIF
To include patients who had UNK service the Computed Finding Parameter is: UNK

Entry Point: OEIF       Routine: PXRMMSER
VA-PATIENT RECORD FLAG INFORMATION
Print Name: VA-Patient Record Flag Information
Class: NATIONAL
Sponsor:
Review Date:

Description:
This multiple type computed finding returns information about the specified flag for a patient. The flag is specified by putting the exact name of the flag in the Computed Finding Parameter.

The following "CSUBS" are available:

"ACTION" The action
"APPRVBY" Approved by
"ASSIGN DT" Date and time the flag was assigned
"CATEGORY" The category
"DATE" Date of the action
"FLAGTYPE" Flag type
"REVIEW DT" Review date
"TIU TITLE" TIU title associated with the flag

VA-PATIENT RECORD FLAG LIST
Print Name: VA-Patient Record Flag List
Class: NATIONAL
Sponsor:
Review Date:

Description:
This list type computed finding returns a list of all patients who have a specified record flag active any time in the date range.

The Computed Finding Parameter is used to specify the flag in the following format: FLAG NAME^FLAG TYPE

Where FLAG NAME is the exact name of the flag and FLAG TYPE is L for local or N for national. FLAG TYPE is optional and defaults to L.

: Entry Point: GETLST Routine: PXRMPRF
VA-PATIENT TYPE
Print Name: VA-Patient Type
Class: NATIONAL
Sponsor:
Review Date:

Description:
This computed finding is a single value computed finding. If a patient type is found for the patient the computed finding will be true and type will be returned as the Value.

Example: I V="ACTIVE DUTY"

Possible Values that can be returned from this computed finding are:
ACTIVE DUTY
ALLIED VETERAN
COLLATERAL
EMPLOYEE
MILITARY RETIREE
NON-VETERAN (OTHER)
NSC VETERAN
SC VETERAN
TRICARE

Entry Point: PATTYPE Routine: PXRMPDEM

VA-PATIENTS WITH APPOINTMENTS
Print Name: VA-Patients with Appointments
Class: NATIONAL
Sponsor:
Review Date:

Description:
This list computed finding returns a list of patients with appointments in the specified date range. The COMPUTED FINDING PARAMETER can be used to filter the results. The values that can be used in the parameter are: FLDS:F1,F2,... where F1,F2 are any of the possible integer ID values listed in the table for this computed finding in the Computed Finding section of the Clinical Reminders Manager’s Manual. These specify what data associated with the appointment is to be returned; this data can be used in a CONDITION statement. Field number n will be the nth piece of the value. For example FLDS:1,16 would return the Appointment Date/Time in piece 1 and Date Appointment Made in piece 16. A condition such as I $P(V,U,16)>3060301 would be true if the date the appointment was made was after March 1, 2006. If FLDS is not specified then the value will be ID=1 (Appointment Date/Time) and ID=2 (Clinic IEN and Name).

STATUS sets a filter on the appointment status; only those appointments with status on the list will be returned. The possible values for STATUS are R (Scheduled/Kept), I (Inpatient), NS (No-show), NSR (No-show, Rescheduled), CP (Cancelled by Patient),
CPR (Cancelled by Patient, Rescheduled), CC (Cancelled by Clinic),
CCR (Cancelled by Clinic, Rescheduled), NT (No Action Taken).
If STATUS is not specified the default is R,I.

LL: Reminder Location List specifies a list of locations so that only appointments for those locations will be returned. If LL is not specified, then appointments for all locations will be returned.

FLDS, STATUS, and LL are all optional and can be given in any order. Some examples:

FLDS:1,2,16^STATUS:R^LL:DIABETIC LOCATIONS
STATUS:CP,CC^FLDS:25
LL:DIABETIC LOCATION

Entry Point: APPL          Routine:    PXRMRDI

**VA-PCMM MHTC**

Print Name:       VA-PCMM Mental Health Treatment Coordinator
Class:            NATIONAL
Sponsor:          
Review Date:
Description:
This computed finding returns the patient's current Mental Health Treatment Coordinator (MHTC). The Scheduling API that this computed finding uses does not take a date as a parameter so it only returns the MHTC as of the actual calendar date. Therefore, this computed finding cannot be used to determine if the patient had an MHTC sometime in the past.

The default value of the computed finding is the MHTC. The following additional CSUBs are returned:

MHTC - Mental Health Treatment Coordinator ROLE - role TEAM - team TEAM
POSITION - team position

**VA-PCMM PATIENTS ASSIGNED TO A PRACTITIONER**

ROUTINE: PXRMPCCM           ENTRY POINT: PTPR
PRINT NAME: VA-PCMM Patients Assigned to a Practitioner
TYPE: LIST
CF PARAMETER REQUIRED: YES
DESCRIPTION: This list type computed finding returns a list of patients assigned to a list of practitioners in the date range defined by Beginning Date/Time and Ending Date/Time. The Computed Finding Parameter is used to specify the practitioners. Each practitioner is separated by a semicolon. Either the IEN or the exact name (.01 field) from file #200, the New Person file, can be used. IENs and names can be mixed.

Please note: When you identify a practitioner in the Computed Finding Parameter field, only patients who are directly linked to that practitioner will be included. Any patients that are only associated with that practitioner in a PRECEPTOR role, through an assignment to an Associate Provider, will NOT be included.
To get patients who are linked to a Preceptor via an Associate Provider, you would need to run a separate report for the Resident (Associate Provider) or include an additional entry of the Computed Finding with the resident’s name or IEN.

The Computed Finding Parameter can also be used to pass the optional parameter INCLUDE. If you want to use this parameter, it is passed as the second piece of the Computed Finding Parameter. The possible values of INCLUDE are:

0 - include patients who were assigned anytime in the date range.
1 – include patients who were assigned for the entire date range.

The default is 0.

The format for the computed finding parameter is: PRACTITIONER(s)^INCLUDE

Here is an example of how to specify a list of practitioners, two by name and one by IEN:

PROVIDER,ONE;345;PROVIDER,SIX

In the above example, INCLUDE is not specified, so it takes the default value of 0. To set the value of INCLUDE to 1 with the above list, the computed finding parameter would be:

PROVIDER,ONE;345;PROVIDER,SIX^1

VA-PCMM PATIENTS ASSIGNED TO A TEAM
Print Name: VA-PCMM Patients Assigned to a Team
Class: NATIONAL
Sponsor:
Review Date:

Description:
This list type computed finding returns a list of patients assigned to a team in the date range specified by Beginning Date/Time and Ending Date/Time. If the patient was assigned to the team at anytime during the date range they will be on the list. The Computed Finding Parameter is used to specify the team. It can be either the IEN or the exact name (.01 field) from file #404.51, the Team file.

The Computed Finding Parameter can be used to pass the optional parameter INCLUDE. If you want to use this parameter, it is passed as the second piece of the Computed Finding Parameter. The possible values of INCLUDE are:

0 - include patients who were assigned anytime in the date range. 1 - include patients who were assigned for the entire date range.

The default is 0.

The format for the computed finding parameter is: TEAM^INCLUDE

For example, if the team is TEAM ONE and you want the value of INCLUDE to be 1, then the computed finding parameter would be: TEAM ONE^1

: 

Entry Point: TEAM       Routine:  PXRMPcin

VA-PROGRESS NOTE
Print Name: VA-Progress Note
Class: NATIONAL
Sponsor:
Review Date:

Description:
This computed finding will return multiple instances of a progress note based on the exact title of the TIU DOCUMENT DEFINITION or the internal entry number (IEN) of the TIU DOCUMENT DEFINITION. If the IEN is used, it should be preceded by the "\" character. The note title or IEN is specified in the COMPUTED FINDING PARAMETER field. If you want to search for notes with a certain status, then append "^status" to the title. Status can be any of the following:
1 = UNDICTATED
2 = UNTRANSCRIBED
3 = UNRELEASED
4 = UNVERIFIED
5 = UNSIGNED
6 = UNCOSIGNED
7 = COMPLETED
8 = AMENDED
9 = PURGED
10 = TEST
11 = ACTIVE
13 = INACTIVE
14 = DELETED
15 = RETRACTED

If status is not specified, then the default is to search for notes with a status of COMPLETED.

For example, if the COMPUTED FINDING PARAMETER field contains:
ADMITTING HISTORY & PHYSICAL^5, the search would be for notes with the exact title of "ADMITTING HISTORY & PHYSICAL" and a status of "UNSIGNED."

If the IEN were used then the COMPUTED FINDING PARAMETER filed would be: `1091^5

Note: The specified TIU DOCUMENT DEFINITION must have a TYPE of "DOC"; if it does not, the computed finding will always be false.

The values returned by this computed finding that can be used in the Condition are V=note title, V("TITLE")=note title and V("AUTH")=author of note.

Additional data for use in the Condition can be obtained by appending "^1" after the status; for example:
ADMITTING HISTORY & PHYSICAL^5^1
ADMITTING HISTORY & PHYSICAL^5^1

(In the second example, since the status is blank, it would default to notes with a status of COMPLETED.)

The additional data is:

V("DISPLAY NAME")=Display name of TIU title.

V("EPISODE BEGIN DATE/TIME")=String_.":_EPISODE BEGIN DATE/TIME where String is "Adm" for ward locations and "Visit" for all other location types. Date/time is in MM/DD/YY format.

V("EPISODE END DATE/TIME")=String_."_EPISODE END DATE/TIME where string is null if no date/time or "Dis: " if date/time exists. Date/time is in MM/DD/YY format

V("HOSPITAL LOCATION")=External format of HOSPITAL LOCATION from TIU DOCUMENT file
V("NUMBER OF IMAGES")=Number of images associated with TIU DOCUMENT entry

V("REQUESTING PACKAGE")=REQUESTING PACKAGE REFERENCE field from TIU DOCUMENT file (internal format)

V("SUBJECT")=SUBJECT (OPTIONAL description) field from TIU DOCUMENT file (note that characters are limited to ensure returned string is not longer than 255 characters).

The possible values are those in the RACE file (#10). If there is an entry, the computed finding will be true; otherwise it will be false.

Entry Point: RACE    Routine: PXRMPDEM

VA-RANDOM NUMBER
Print Name: VA-Random number
Class: NATIONAL
Sponsor:
Review Date:

Description:
This computed finding uses the MUMPS $RANDOM function to return pseudo random numbers as the value. The Occurrence Count is the number of random numbers that will be returned and the Computed Finding Parameter is used to specify the range and optionally the number of decimal digits; the default is to generate integers, i.e., no decimal digits. The Occurrence Count entry on the finding will be an absolute value. Entering an Occurrence Count of 5 or -5 will result in 5 returns.

The format of the Computed Finding Parameter is: LB^UB^NDD, where LB is the inclusive lower bound, UB is the inclusive upper bound, and NDD is the optional number of decimal digits. LB and UB must be integers and UB must be greater than LB. If these conditions are not met then the computed finding will be false.

Some examples:
0^500 - integers in the range 0 to 500
0^1^1 - numbers in the range 0 to 1 with one decimal place
-1^1^2 - numbers in the range -1 to 1 with two decimal places

***Please note: This CF was developed for research program consideration/use. No clinical uses have been identified at present. Every evaluation of this finding on a given patient will yield different results, thus the name RANDOM. Please use caution when using this Computed Finding in a clinical setting.***

Entry Point: RANDOM    Routine: PXRMMATH
VA-REMINDER DEFINITION
Print Name: VA-Reminder Definition Computed Finding

Class: NATIONAL

Sponsor:

Review Date:

Description:
This computed finding will evaluate the reminder definition that is specified by name in the COMPUTED FINDING PARAMETER field. The name that is used is the NAME field (.01) of the reminder definition, not the PRINT NAME, additionally the definition must be active. The computed finding will be false if the reminder evaluation status is CNBD or ERROR, in all other cases it will be true.

The default date of the finding is the evaluation date; this can be overridden by appending "^DATE=DUE DATE" or "^DATE=LAST DONE" to the reminder name. If a last done date cannot be determined then the date of the finding will be the evaluation date.

Examples:
VA-IHD LIPID PROFILE
VA-IHD LIPID PROFILE^DATE=LAST DONE
VA-IHD LIPID PROFILE^DATE=DUE DATE

The VALUE array, which can be used in a Condition, will contain the evaluation status, due date, and last done date. The date values are in VA FileMan format. The variable V is the reminder evaluation status. Possible values for the reminder evaluation status are:
DONE
DUE NOW
DUE SOON
RESOLVED
NEVER
N/A

Example of the Value array:
VALUE("STATUS")="DUE NOW"
VALUE("DUEDATE")=3051010.1220
VALUE("LASTDONE")=3051010.1220

Condition examples:
I V="DUE NOW"
I V("STATUS")="DUE NOW"
I V("DUEDATE")>3051010.1220
I V("LASTDONE")=3051010.1220

***WARNING*** This computed finding can be used to evaluate a reminder inside of a reminder evaluation - do not have this computed finding evaluate the same reminder as the one being evaluated.

VA-TREATING FACILITY LIST
Print Name:  VA-Treating Facility List
Class:  NATIONAL
Sponsor:  
Review Date:  

Description:
This multi-occurrence computed finding returns a list of treating facilities i.e., systems that store data related to a patient. The value for each entry is:

STATION NUMBER^NAME^DATE LAST TREATED^ADT/HL7 EVENT REASON^FACILITY TYPE

STATION NUMBER, NAME, and FACILITY TYPE are from the Institution file. FACILITY TYPE is one of the entries found in the FACILITY TYPE file. ADT/HL7 EVENT REASON is a code from the ADT/HL7 EVENT REASON file. If there is no ADT/HL7 EVENT REASON then DATE LAST TREATED will also be null.

Some examples of values that are returned:
"516^BAY PINES VAMC^^^VAMC"
"537^JESSE BROWN VAMC^3041122.110926^3^VAMC"
"552^DAYTON^3001113.092056^3^VAMC"'
"556^NORTH CHICAGO VAMC^3050406.13^3^VAMC"
"578^HINES, IL VAMC^3020919.2324^3^VAMC"
"589^VA HEARTLAND - WEST, VISN 15^^^VAMC"
"636^VA NWIHS, OMAHA DIVISION^^^VAMC"
"673^TAMPA VAMC^3001215.1327^3^VAMC"
"695^MILWAUKEE VAMC^3030328.13^3^VAMC"

A CONDITION can be written that uses any of the pieces of the value. For example, a CONDITION to check that the FACILITY TYPE is VAMC would be: I $P(V,U,5)="VAMC"

Since no date can be associated with an entry, the date of evaluation will be used.

VA-WH MAMMOGRAM ABNORMAL IN WH PKG
Print Name: VA-WH Mammogram Abnormal in WH pkg
Class: NATIONAL
Sponsor: Women Veterans Health Program
Review Date:

Description:

This computed finding calls an API to the WH package that returns up to n number for a specific date range of Mammogram procedures found in the WH package that have an abnormal diagnosis.
The result from the computed finding will be returned in the Data Array; the format of the array is:
DATA(n,"LINK")= DATA(n,"STATUS")= DATA(n,"VALUE")= DATA(n,"WVIEN")=

The data assigned to the Link subscript is a boolean value. If the value is a 1, then the Mammogram procedure was entered through the Radiology package.

The data assigned to the Status subscript is used to determine if the procedure is Open, Closed, or Pending. Pending means that the Mammogram procedure in the Women's Health package needs to have a result entered. Open means that the Mammogram procedure has been resulted but the provider has not closed the case. Closed means that a result has been entered for the procedure and it has been closed.

The data assigned to the Value subscript is used to determine the diagnosis of the Mammogram procedure. The diagnosis in the Women's Health package can either be Normal, Abnormal, or Unsatisfactory. For this computed finding, the Value should always be Abnormal.

The data assigned to the WVIEN subscript is the Women's Health procedure IEN.

The text display in the Clinical Maintenance will be found in the Text array.

VA-WH PATIENT DOCUMENTATION
Print Name: Women's Health Patient Documentation
Type: MULTIPLE
Class: NATIONAL
Sponsor: Women Veterans Health Program
Review Date:

Description:

This computed finding returns up to N number (within a specific date range) of pregnancy or lactation statuses found in the Women's Health software package.

To retrieve pregnancy statuses, set the first caret piece of the COMPUTED FINDING PARAMETER value to PREGNANCIES.

To retrieve lactation statuses, set the first caret piece of the COMPUTED FINDING PARAMETER value to LACTATIONS.

The second caret piece of the COMPUTED FINDING PARAMETER value is used to identify this finding's return data for use in the VA-WH UPDATE PREGNANCY STATUS and VA-WH UPDATE LACTATION STATUS reminder dialogs. Setting this piece to DATA will identify it.

The third caret piece of the COMPUTED FINDING PARAMETER value is used to calculate the grace period during which a patient is considered pregnant. The grace period begins on the expected delivery date and ends on the date calculated from this piece. The format of this piece is NX where N is a
whole number greater than zero and X is a letter representing an interval of time (Y for year, M for month, W for week, D for day and H for hour). If this piece is blank, four weeks ("4W") will be used to calculate the grace period. This piece is only applicable when the first caret piece is set to PREGNANCIES.

For example,

**COMPUTED FINDING PARAMETER: PREGNANCIES^DATA^3W**

This finding will always return true, even when no documentation is on file. Refer to the DOCUMENTATION STATUS CSUB subscript to determine whether documentation is on file.

The CONDITION field may make use of the following CSUB subscripts when the first caret piece of the COMPUTED FINDING PARAMETER is set to PREGNANCIES:

\[
\begin{align*}
V(N,"\text{MEDICALLY UNABLE TO CONCEIVE}) &= \\
V(N,"\text{MEDICAL REASON}) &= \\
V(N,"\text{TRYING TO BECOME PREGNANT}) &= \\
V(N,"\text{PREGNANCY STATE}) &= \\
V(N,"\text{PREGNANCY DAS}) &= \\
V(N,"\text{PREGNANCY DATA SOURCE}) &= \\
V(N,"\text{CONTRACEPTIVE METHOD USED},X) &= \\
V(N,"\text{PREGNANCY LIKELIHOOD}) &= \\
V(N,"\text{LAST MENSTRUAL PERIOD DATE}) &= \\
V(N,"\text{EDD}) &= \\
V(N,"\text{EDD-GRACE}) &= \\
V(N,"\text{PREGNANCY END DATE}) &= \\
V(N,"\text{REASON PREGNANCY ENDED}) &= \\
V(N,"\text{OVERRIDE CALCULATED EDD REASON}) &=
\end{align*}
\]

The CONDITION field may make use of the following CSUB subscripts when the first caret piece of the COMPUTED FINDING PARAMETER is set to LACTATIONS:

\[
\begin{align*}
V(N,"\text{LACTATION STATE}) &= \\
V(N,"\text{LACTATION DAS}) &= \\
V(N,"\text{LACTATION DATA SOURCE}) &= \\
V(N,"\text{END DATE}) &=
\end{align*}
\]

The CONDITION field may make use of the following CSUB subscripts when the first caret piece of the COMPUTED FINDING PARAMETER is set to PREGNANCIES or LACTATIONS:

\[
\begin{align*}
V(N,"\text{DATE/TIME}) &= \\
V(N,"\text{DOCUMENTATION STATUS}) &= \\
V(N,"\text{VISIT}) &=
\end{align*}
\]

The CONDITION field may make use of the following CSUB subscripts when the second caret piece of the COMPUTED FINDING PARAMETER is set to DATA and the first caret piece is set to PREGNANCIES or LACTATIONS:

\[
\begin{align*}
V(N,"\text{DIALOG}) &= \\
V(N,"\text{PACKAGE}) &= \\
V(N,"\text{PACKAGE PREFIX}) &=
\end{align*}
\]
When retrieving pregnancy statuses, the value assigned to the PREGNANCY STATE subscript is used to determine if the patient is pregnant and is one of PREGNANT, NOT PREGNANT or DO NOT KNOW. When retrieving lactation statuses, the value assigned to the LACTATION STATE subscript is used to determine if the patient is lactating and is one of LACTATING or NOT LACTATING.

The value assigned to the MEDICALLY UNABLE TO CONCEIVE subscript is used to determine if a patient is medically able to conceive and is one of YES or NO. Keep in mind that the values of this subscript are opposite of what you may think: a value of NO means the patient is medically able to conceive.

The value assigned to the MEDICAL REASON subscript is the text entered by the provider for why the patient is medically unable to conceive.

The value assigned to the TRYING TO BECOME PREGNANT field is used to determine if a patient is consciously trying to become pregnant and is one of YES or NO.

The data assigned to the CONTRACEPTIVE METHOD USED subscript is the method(s) the patient is using to avoid pregnancy. This subscript contains a numbered list that starts at one and increments by one. For example:

```
V(N,"CONTRACEPTIVE METHOD USED",1)="MALE CONDOM"
V(N,"CONTRACEPTIVE METHOD USED",2)="PILL, VAGINAL RING OR PATCH"
```

The value assigned to the PREGNANCY LIKELIHOOD subscript is the likelihood of the patient becoming pregnant while using the contraceptives returned in the CONTRACEPTIVE METHOD USED subscript. This subscript has a value of HIGH, LOW or UNKNOWN.

The value assigned to the LAST MENSTRUAL PERIOD DATE subscript is the start date of the patient's last menstrual period.

The value assigned to the EDD subscript is the expected due date.

The value assigned to the EDD-GRACE subscript is the end date of the EDD grace period. When a patient's EDD is in the past and there is no updated documentation on file, there is a grace period after which the system will no longer consider the patient pregnant even though the documentation is not updated.

The value assigned to the OVERRIDE CALCULATED EDD REASON subscript is the text entered by the provider in the VA-WH UPDATE PREGNANCY STATUS reminder dialog for why the expected due date was changed from the calculated value.

The value assigned to the PREGNANCY END DATE subscript is the date the patient's pregnancy ended.

The value assigned to the REASON PREGNANCY ENDED subscript is the text entered by the provider in the VA-WH UPDATE PREGNANCY STATUS reminder dialog for why the pregnancy ended.
The value assigned to the END DATE subscript is the date the patient stopped lactating.

The value assigned to the PREGNANCY DAS and the LACTATION DAS subscripts is the Internal Entry Number String (IENS) value identifying the record in the Women's Health software package from which this status data came.

The value assigned to the PREGNANCY DATA SOURCE and the LACTATION DATA SOURCE subscripts is the entry in the PACKAGE file of the software package that collected the status data from the end user.

The value assigned to the DATE/TIME subscript is the date and time the status was entered. Note that the DATE subscript does not contain the time.

The value assigned to the DOCUMENTATION STATUS subscript is the completeness of the documentation. This subscript has a value of COMPLETE, INCOMPLETE or NO DOCUMENTATION.

The value assigned to the VISIT subscript is the Text Integration Utilities (TIU) visit string value representing the entry in the VISIT file associated with this status.

The value assigned to the DIALOG subscript is 1 and is part of the identifier used to differentiate a specific instance of this finding for use by the VA-WH UPDATE PREGNANCY STATUS and VA-WH UPDATE LACTATION STATUS reminder dialogs.

The value assigned to the PACKAGE subscript is the name of the software package from which the finding's data comes from; this value is WOMEN'S HEALTH.

The value assigned to the PACKAGE PREFIX subscript is the prefix for the software package from which the finding’s data comes from; this value is WV.

Entry Point: DOCSTAT   Routine:  PXRMCWH1

VA-WH PATIENT IS PREGNANT/LACTATING
Print Name:  Women's Health Check If Patient is Pregnant or Lactating
Type:          MULTIPLE
Class:          NATIONAL
Sponsor:        Women Veterans Health Program
Review Date:

Description:

This computed finding will check if a patient is documented as pregnant or lactating. It will return true if a patient is pregnant/lactating on a specific date or was pregnant/lactating on at least one day within a date
range. It will return false if the patient was not pregnant/lactating or the status was unknown on a specific date or for all days within a date range. If no date is specified, the value of TODAY is used. You may specify a specific date in either the Beginning Date/Time or Ending Date/Time parameters.

Caution: This computed finding groups the statuses NOT PREGNANT and DO NOT KNOW into a single NOT PREGNANT OR UNKNOWN status. If you need a precise pregnancy status for a patient, use the VA-WH PATIENT DOCUMENTATION reminder computed finding.

To check if the patient is pregnant, set the first caret piece of the COMPUTED FINDING PARAMETER value to PREGNANT.

To check if the patient is lactating, set the first caret piece of the COMPUTED FINDING PARAMETER value to LACTATING.

The second caret piece of the COMPUTED FINDING PARAMETER value determines how the end date of a pregnancy is calculated when no end date is specified. Setting this piece to DIALOG will set the end date to tomorrow’s date. Leaving this piece empty will set the end date to the date the NOT PREGNANT status was entered.

The CONDITION field may make use of the "STATUS" CSUB subscript. This subscript contains a textual representation of the patient's status. When the first caret piece of the COMPUTED FINDING PARAMETER value is PREGNANT, possible values are "PREGNANT" and "NOT PREGNANT OR UNKNOWN". When the first caret piece of the COMPUTED FINDING PARAMETER value is LACTATING, possible values are "LACTATING" and "NOT LACTATING OR UNKNOWN". For example:

I V(1,"STATUS")="PREGNANT"

VA-WH PROCEDURES WITH NO NOTIFICATION
Print Name: Procedures with no notification
Type: MULTIPLE
Class: NATIONAL
Sponsor: Women Veterans Health Program
Review Date:

Description:

This computed finding searches an active Cascade type to find any Women’s Health Procedures between the beginning and ending dates that do not have a notification type on file or still have an open notification entry on file.

Computed Finding Parameter NAME = Cascade type to search for – BREAST CARE is the only available name at this time.
Return Values
DATA("DAS")=The internal entry number (IEN) from file 790.1.
  Multiple IEN are delimited by a colon ":".
DATA("DIALOG")=1
DATA("PACKAGE")="WOMEN'S HEALTH"
DATA("PACKAGE PREFIX")="WV"

The DIALOG subscript is used to let the Reminder Dialog Branching Logic
build the dialog element/group display text from the TEXT node from the
computed finding output. This subscript is also used by branching logic to
map the results to a Reminder General Finding entry.

The PACKAGE and PACKAGE PREFIX subscripts are both used in the Reminder
Dialog Branching Logic processes when mapping the computed finding results
to a Reminder General Finding entry.

Entry Point: NONOTIFD   Routine:   PXRMCWH
Reminder Definition Management

This PowerPoint presentation, used for VistaU distance learning, provides a good overview of how reminder definitions work.

This menu contains options for creating, editing, copying, activating, and displaying clinical reminder definitions.

National Reminders, identified by having a CLASS of NATIONAL and a name starting with VA-, cannot be edited. If you cannot use a national reminder “as is” then copy to a new name, at which point it becomes local, and then edit the reminder to meet your requirements.

Sites may change anything in a local reminder definition to meet their needs. Findings at each site may require modification to represent local use of clinical data.

Patch 45 (PXRM*2*45) Changes to Reminder Definition

Added a new possible value to the Reminder Definition Usage Field:
A: Action

The A will not allow a reminder to be used on the CPRS coversheet unless the value of C is set also in the usage field.

Patch 24 (PXRM*2*24) High Risk Mental Health Patient - Reminder and Flag: Changes to Reminder Definitions

1. New Reminder Definitions:
   • VA-MH HIGH RISK NO-SHOW ADHOC RPT
     No reminder dialog is associated with this reminder. This new Reminder Definition looks for the first appointment found, given a date and time and looking through the rest of the day. It is resolved if the finding is documented within 1 week. It is used by the SD MH NO SHOW AD HOC REPORT to get Results related to the follow-up reminder for each missed appointment date/time, if results are available.

   Example of Results section that prints after the Future Scheduled Appointments:

<table>
<thead>
<tr>
<th>Future Scheduled Appointments: NO APPOINTMENTS SCHEDULED WITHIN 30 DAYS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Results:</td>
</tr>
<tr>
<td>Resolution: Last done 05/14/2012@12:00</td>
</tr>
<tr>
<td>Reminder Term: VA-MH NOSHOW PT EMERGENT CARE</td>
</tr>
<tr>
<td>Health Factor: MH NOSHOW PT EMERGENT CARE</td>
</tr>
<tr>
<td>05/14/2012@12:00</td>
</tr>
<tr>
<td>Reminder Term: VA-MH SUICIDE ATTEMPTED</td>
</tr>
<tr>
<td>Health Factor: MH SUICIDE ATTEMPTED</td>
</tr>
<tr>
<td>05/14/2012@12:00</td>
</tr>
</tbody>
</table>

   • VA-MHTC NEEDS ASSIGNMENT
     • This reminder looks for the most recent three completed appointments to MH clinics over the past year and checks to see if an MHTC is currently assigned to the patient. If no MHTC is assigned, the reminder will be due.
     • The reminder definition uses the new VA-PCMM MHTC computed finding.
     • There is no reminder dialog related to this reminder.
     • This reminder can be used from CPRS to show as due on the CPRS GUI Cover Sheet.
     • This reminder can also be used from Reminder Reporting options/Reminder Due Report. Reminder CACs can create a Reminder Due Report (User) template for an SPC user to get the list of patients who are scheduled for a MH appointment next week and are candidates for MHTC.
     • Uses Reminder Term VA-MH APPTS FOR MHTC ASSIGNMENT, which uses a new Reminder Location List called VA-MHTC APPT STOP CODES LL in the Computed Finding VA-Appointments for a Patient. The new Reminder Location List is consistent with the national list of MH Encounter Stop Codes defined for sites by the Office of Mental Health Services.
2. Changed the dialog info text presented to the user to clarify that the reminder is resolved if a completed encounter is found for a MH appointment on the same day, or within 72 hours of the missed MH appointment.
3. **Added Category I PRF for HIGH RISK FOR SUICIDE to the Reminder Definition.** The reminder now looks for both the Category I and Category II active PRF for High Risk for Suicide.

<table>
<thead>
<tr>
<th>--STATUS--</th>
<th>--DUE DATE--</th>
<th>--LAST DONE--</th>
</tr>
</thead>
<tbody>
<tr>
<td>High Risk MH No-Show Follow-up</td>
<td>DUE NOW</td>
<td>DUE NOW</td>
</tr>
</tbody>
</table>

Frequency: Due every 99Y - Once for all ages.
Reminder triggered by missed MH appointment and when resolved won't be due again until another missed MH appointment occurs.

The patient has an active High Risk for Suicide Patient Record Flag and missed a MH appointment.

**Cohort:**
- **Reminder Term:** VA-MH NOSHOW MISSED MH CLINIC APPTS
- **Computed Finding:** VA-Appointments for a Patient
  04/09/2012@12:00 value - Mental Health
  CLINIC: Mental Health
  APPOINTMENT STATUS: NO-SHOW

- **Reminder Term:** VA-MH HIGH RISK FOR SUICIDE PRF
  **Computed Finding:** VA-Patient Record Flag Information
  01/31/2012@11:08:45 value - NEW ASSIGNMENT;
  Flag - HIGH RISK FOR SUICIDE(I (NATIONAL)).
  Assigned Jan 31, 2012@11:08:45 by CRPROVIDER,SIX. New record flag assignment.
  12/21/2010@15:36:02 value - NEW ASSIGNMENT;
  Flag - HIGH RISK FOR SUICIDE(II (LOCAL)).
  Assigned Dec 21, 2010@15:36:02 by CRPROVIDER, TWO. New record flag assignment.

4. **Change to VA-MH HIGH RISK NO-SHOW FOLLOW-UP reminder definition:**
   - Removed Occurrence Count of 5 from RT.VA-MH NOSHOW MISSED MH CLINIC APPTS Hospital Location and only defined occurrence at the Reminder Definition level.
   - It still looks back 10D and resolves with specific health factors entered from the reminder dialog the same day or a completed MH Appointment within 8 hours before or 72 hours after.
   - Modifies the Reminder Dialog to include the Suicide Behavior Report(SBR) for optional entry.
   - If there are several No-show appointments for a given day, responses to any of the no-show appointments (even the earliest appointment) on that day will resolve all of the no-show follow-ups for that day.

No-show health factors entered at any time on the date of the missed appointment resolve all no-show appointment follow-up on that day.
Example:

Clinical Maintenance output after selecting 8am appointment

<table>

</tbody>
</table>
5. Three terms were removed (VA-MH NOSHOW SUPPORT CONTACT, VA-MH NOSHOW INITIATE WELLNESS CHECK, VA-MH NOSHOW UNABLE TO REACH PT) from the reminder definition, since they are no longer valid responses in the related reminder dialog.

6. New functionality was added that gives Clinical Reminders the ability to send notifications. The specific notification is SUICIDE ATTEMPTED /COMPLETED.

7. For list-type reminders, the definition integrity checker was not correctly checking the Baseline Age Findings to make sure that an age range was defined. This was corrected.

Patch 18 (PXRM*2*18- High Risk Mental Health Patient - Reminder and Flag-phase 1)
Updates for Reminder Definitions

Changes to National Reminder Definitions

Summary:
1. Updated branching logic reminders for OEF/OIF screening:
   a. Fixed the problem that patients who do not have the required LSSD entry are not having the items show as due when they have been done.
   b. Removed refusals and other exclusions from the branching logic – if not done, then show the item as open and allow the parent reminder to use the exclusions instead of also evaluating them in the branching logic. This makes all 7 of the branching logic reminders consistent.
2. Updated the URLs for MH screening.
3. Added '0' to the Within Category Rank for EF-NO BLAST/EXPLOSION INJURY and EF-NO BULLET INJURY in the reminder VA-EMBEDDED FRAGMENTS RISK EVALUATION.
4. Added occurrence count of 4 to AUD C in the alcohol screening reminder.
5. Fixed header/info text in AAA reminder.
6. Distributed H1N1 reminders and dialog via patch and distribute and inactivate.
7. Updated VA-ALCOHOL F/U POS AUDIT-C dialog to display the education and advice interventions without a box around both and also to have the results of an AUDIT-10 go into the progress note.
8. Distributed the updates to the VA-MHV INFLUENZA VACCINE reminder.

Detailed Descriptions:
1. Updated branching logic reminders
   VA-BL DEPRESSION SCREEN
   Removed RT.VA-ACTIVE DUTY
   Cohort: changed to due for all
   Resolution: changed to resolve for any entry that is not before the LSSD
   Changed the logic from
   MRD(VA-DEPRESSION SCREEN NEGATIVE,VA-DEPRESSION SCREEN POSITIVE)>MRD(VA-LAST SERVICE SEPARATION DATE)
   To
   MRD(VA-DEPRESSION SCREEN POSITIVE,VA-DEPRESSION SCREEN NEGATIVE)<MRD(VA-LAST SERVICE SEPARATION DATE)
VA-BL ALCOHOL SCREEN
   Removed RT.VA-ACTIVE DUTY
   Cohort: changed to due for all
   Removed exclusions
   Resolution: changed to resolve for any entry that is not before the LSSD

VA-BL PTSD SCREEN
   Removed RT.VA-ACTIVE DUTY
   Cohort: changed to due for all
   Removed exclusions
   Resolution: changed to resolve for any entry that is not before the LSSD
   Added a '0' to the Within Category Rank for the health factors.

VA-BL OEF/OIF EMBEDDED FRAGMENTS
VA-BL OEF/OIF FEVER
VA-BL OEF/OIF GI SX
VA-BL OEF/OIF SKIN SX
   Removed RT.VA-IRAQ/AFGHAN PERIOD OF SERVICE and substitute CF.VA-LAST
   SERVICE SEPARATION DATE
   Removed RT.VA-ACTIVE DUTY
   Cohort: changed to due for all
   Resolution: changed to resolve for any entry that is not before the LSSD

2. Updated URLs
   VA-ALCOHOL USE SCREEN (AUDIT-C)
   VA-DEPRESSION SCREENING
   VA-PTSD SCREENING

3. VA-EMBEDDED FRAGMENTS RISK EVALUATION: Added '0' to the Within Category Rank for
   EF-NO BLAST/EXPLOSION INJURY and EF-NO BULLET INJURY

4. VA-ALCOHOL USE SCREENING (AUDIT-C)
   a. Added occurrence count of 4 to AUD C in the alcohol screening reminder
   b. Updated the dialog by changing 'Optional open and optional complete (partial complete
      possible)' to 'Optional open and required complete or cancel before finish'.

5. Fixed grammatical error in VA-TEXT INFO SCREEN FOR AAA

6. Distributing reminders VA-INFLUENZA H1N1 IMMUNIZATION, VA-INFLUENZA H1N1
   IMMUNIZATION HIGH RISK, and dialog VA-INFLUENZA H1N1 IMMUNIZATION (DIALOG).
   Distribute as INACTIVE.

7. Updated VA-ALCOHOL F/U POS AUDIT-C dialog to display the education and advice
   interventions without a box around both and also to have the results of an AUDIT-10 go into the
   progress note. Added an * to the word 'required' in 2 of the captions.

8. Distributing the updates to the VA-MHV INFLUENZA VACCINE reminder which update the age
   range and also the date of the reminder term for vaccination for the '10-'11 flu season.
Enhancements in Patch 18

New options

Two new options were added to the reminder definition management menu:

- Integrity Check Selected
- Integrity Check All.

These can be used to check the integrity of selected or all reminder definitions. The integrity check will also be made automatically whenever a reminder definition has been edited. Fatal errors (F) that will prevent the reminder from working properly and warnings (W) will be given. The following checks are made:

F – Each finding is checked to make sure it exists
F – If either the Beginning Date/Time or Ending Date/Time contains FIEVAL(M,"DATE") or FIEVAL(M,N,"DATE"), the definition is checked to make sure it contains finding M, and if an occurrence is used, the Occurrence Count of finding M is checked to make sure it is greater than or equal to N.
F – Function findings functions of the form FUNCTION(M) and FUNCTION(M,N) are checked to make sure finding M is in the definition and the Occurrence Count of finding M is greater than or equal to N.
F – If a Custom Date Due is defined, it is checked to make sure that the findings used in the Custom Date Due all exist in the definition.
F – Patient Cohort Logic and Resolution Logic are checked to make sure that the findings used in the logic all exist in the definition.
F – Logic strings are checked to make sure their syntax is valid.
F – The definition contains Resolution Logic but does not have a baseline frequency or any findings that will set a frequency.
W – The Usage field contains a “P” and it is not a national reminder.
W – The definition contains Resolution Logic but does not have a baseline frequency. It does have findings that will set a frequency. This could be a problem if all findings that set frequency are false.

New functionality was added to allow using the date of one finding to set the date range of another finding. The syntax for the date of a finding is FIEVAL(M,"DATE") or FIEVAL(M,N,"DATE"), where M is the finding number and N is the occurrence. This means you can now use dates like FIEVAL(3,"DATE")-3W as the Beginning or Ending Date/Time of another finding. The global reminder dates PXRMDOB and PXRMLAD can also be used. Note that if FIEVAL(M) is false or PXRMLAD does not exist, then the finding whose date range depends on the date of finding M will be set to false.

In conjunction with allowing FIEVAL(M,N,"DATE") to be used in Beginning Date/Time or Ending Date/Time, additional frequency units were added. The allowed values are now: H (hours), D (days), W (weeks), M (months), and Y (years). This change applies everywhere that a frequency can be used, including Beginning Date/Time, Ending Date/Time, Reminder Frequency in the Baseline Age Findings multiple, Findings multiple, Function Findings multiple, and Custom Date Due. Custom Date Due will now allow both “+” and “-”; in the past it only allowed “+”.

Fixes

Remedy ticket #360708 reported a problem with the incorrect calculation of the resolution date when the resolution logic contains function findings. This was because the resolution date calculation was not properly differentiating between true and false function findings. This was corrected.

Remedy ticket #413731 pointed out a problem with non-VA meds that turned out to be two problems. The first is the existing issue where the Index for non-VA meds has incorrect entries. Remedy ticket
#347730 reporting this problem was submitted September 4, 2009 and it still has not been fixed by Pharmacy. The second problem was a display issue. By default, the date of a drug finding is the stop date. If USE START DATE is true, the date of a drug finding is the start date. However, even when USE START DATE was true, the stop date was being displayed as the date of the finding. That has been corrected so that now whichever date is selected for the drug finding will be displayed as its finding date.

The Clin2 support team pointed out that the value for blood pressure can come back in either of the following forms: SYSTOLIC/DIASTOLIC or SYSTOLIC/MAN/DIASTOLIC (the second form is not very common). If the second form comes back, then the DIASTOLIC CSUB would have the value for mean, and if $P was used in a Condition, it would also be the mean. The code was changed so that the DIASTOLIC CSUB will always have the correct value. If you are using $P in a Condition, we recommend that you replace it with the appropriate CSUBs. Several national definitions and terms were originally distributed with Conditions using $P; as part of this patch they will be updated to use the SYSTOLIC and DIASTOLIC CSUBs.

The following updates are made:

**Definitions:**

VA-HTN ASSESSMENT BP \( \geq 140/90 \)
FI(11) CONDITION: \( I \ P(V, "/", 1) > 139! (P(V, "/", 2) > 89) \)
changed to \( I \ (V("SYSTOLIC") > 139)! (V("DIASTOLIC") > 89) \)

FI(13) CONDITION: \( I \ P(V, "/", 1) > 159! (P(V, "/", 2) > 99) \)
changed to \( I \ (V("SYSTOLIC") > 159)! (V("DIASTOLIC") > 99) \)

VA-HTN ASSESSMENT BP \( \geq 160/100 \)
FI(13) CONDITION: \( I \ P(V, "/", 1) > 159! (P(V, "/", 2) > 99) \)
changed to \( I \ (V("SYSTOLIC") > 159)! (V("DIASTOLIC") > 99) \)

VA-HTN LIFESTYLE EDUCATION
FI(11) CONDITION: \( I \ P(V, "/", 1) > 139! (P(V, "/", 2) > 89) \) changed to \( I \ (V("SYSTOLIC") > 139)! (V("DIASTOLIC") > 89) \)

**Terms:**

VA-BP \( \geq 130/80 \)
Mapped item 1: CONDITION: \( I \ P(V, "/", 1) > 130! (P(V, "/", 2) > 80) \)
changed to \( I \ (V("SYSTOLIC") > 130)! (V("DIASTOLIC") > 80) \)

VA-BP \( \geq 130/80 \) (ANY OF LAST 3)
Mapped item 1: CONDITION: \( I \ P(V, "/", 1) > 130! (P(V, "/", 2) > 80) \) changed to \( I \ (V("SYSTOLIC") > 130)! (V("DIASTOLIC") > 80) \)

VA-BP \( \geq 140/90 \)
Mapped item 1: CONDITION: \( I \ P(V, "/", 1) > 139! (P(V, "/", 2) > 89) \)
changed to \( I \ (V("SYSTOLIC") > 139)! (V("DIASTOLIC") > 89) \)

VA-BP \( \geq 160/100 \)
Mapped item 1: CONDITION: \( I \ P(V, "/", 1) > 159! (P(V, "/", 2) > 99) \)
changed to \( I \ (V("SYSTOLIC") > 159)! (V("DIASTOLIC") > 99) \)
On the Nov 19, 2010 national reminder call, there was a discussion about frequency being required. If there is no resolution logic, then frequency is not required as long as AGE is not in the cohort logic (because age is associated with a frequency). When there was no frequency, the status was being returned as CNBD even if there was no resolution logic and no age in the cohort logic. This was changed so that as long as there is no AGE in the cohort logic and no resolution logic, the status will be either DUE or N/A.

There were a couple of errors in the description of the **Usage field**.

**Original Description:**
The Usage field describes how the reminder definition will be used. This field must contain C if the reminder is to be selected in CPRS. The L or the O values will override all other values. For example, if L and C are defined in the usage field, the Reminder will not show on the cover sheet in CPRS, because L is in the Usage field.

This is free text field and can contain any combination of the following codes:

<table>
<thead>
<tr>
<th>Code</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>CPRS</td>
</tr>
<tr>
<td>L</td>
<td>Reminder Patient List</td>
</tr>
<tr>
<td>O</td>
<td>Reminder Order Checks</td>
</tr>
<tr>
<td>P</td>
<td>Patient</td>
</tr>
<tr>
<td>R</td>
<td>Reminder Reports</td>
</tr>
<tr>
<td>X</td>
<td>Reminder Extracts</td>
</tr>
<tr>
<td>*</td>
<td>All of the above, except L, and O.</td>
</tr>
</tbody>
</table>

**Corrected Description:**
The Usage field describes how the reminder definition can be used. This field must contain C or * if the reminder is to be selected in CPRS. The L or the O values will override all other values. For example, if L and C are defined in the Usage field, the Reminder will not show on the cover sheet in CPRS, because L is in the Usage field.

This is free text field and can contain any combination of the following codes:

<table>
<thead>
<tr>
<th>Code</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>CPRS</td>

<td>Patient</td>
</tr>
<tr>
<td>R</td>
<td>Reminder Reports</td>
</tr>
<tr>
<td>X</td>
<td>Reminder Extracts</td>
</tr>
<tr>
<td>*</td>
<td>All of the above, except L, O, and P.</td>
</tr>
</tbody>
</table>
Steps to Define a Working Reminder

There are two parts to creating a working clinical reminder.

- **Reminder definition:** This describes the patients the reminder applies to, how often it is given, and what resolves or satisfies the reminder.
- **Process Issues:** The process issues include who will use the reminder and how the data will be captured. The process issues are extremely important; if they are not worked out, the reminder will never function as intended, even if the definition is correct.

These are the basic steps for defining a reminder. More detailed instructions for creating reminders and dialogs are provided in chapters that follow. As you become more experienced, you will probably develop your own process, but this provides a good starting place.

1. Write the reminder definition in a narrative form that clearly describes what you want the reminder to do. Use this narrative to identify patient data you need and how to capture it. Determine what characteristics the reminder will have (make a list). Which patients will the reminder be applicable for: age ranges, sex, diagnoses, etc. What satisfies the reminder and what makes it not applicable: diagnoses, lab results, x-rays, education, etc.

Reminders provide answers to the questions:

- WHO (findings and patient cohort logic)
- WHAT resolves the reminder (findings and resolution logic)
- WHEN (frequency)
- WHERE this reminder will likely be resolved (location/provider)

2. Review existing reminders to see if there is an existing reminder that is close to what you need.

3. Create new findings if they are required. For example, you may need exams or health factors.

4. Copy the existing reminder and edit it to meet your needs, or define a new reminder.

5. Test your reminder definition by evaluating the reminder for test patients. You should have patients who are in the cohort and who are not in the cohort. For patients who are in the cohort, you should have some who have the reminder resolved and some who do not.

6. Create a reminder dialog (following instructions in the Reminder Dialog section of this manual), if desired, for resolving the reminder in CPRS.

7. Once you are certain the reminder works as intended, set it up in one or more of the following applications:
   - Add it to a health summary
   - Make it available to users through the CPRS GUI

**NOTE:** The procedure for making a health summary available in the CPRS GUI is found on page 317.
List Reminder Definitions

This option prints a summary of reminder definitions. You can limit the list by several criteria: all reminders, all national reminders, all local reminders, print name, or .01 name.

Example: List Reminder Definitions by National Reminders

NOTE: Only the first few of the reminder definitions are deleted from this example, for brevity’s sake.

--------------------------------------------------------------------------------
Name:        VA-*IHD 412 ELEVATED LDL REPORTING
Print Name:  IHD 412 Elevated LDL Reporting
Class:       NATIONAL
Sponsor:     Office of Quality & Performance
Review Date:
Usage: DATA EXTRACT, REPORTS
Priority:
Reminder Description:
Compliance reporting measures the management of IHD patients with an
ICD-9 412.nn diagnosis, whose most recent LDL is greater than or equal to 120mg/dl as defined by the VA External Peer Review Program (EPRP) performance measure and the maximum guideline recommended below:

The VHA/DOD Clinical Practice Guideline for Management of Dyslipidemia recommends an LDL goal of <120 mg/dl for patients with Ischemic Heart Disease; and the NCEP Adult Treatment Panel II recommends a more stringent goal of <100 mg/dl.

This national IHD 412 Elevated LDL Reporting reminder is used monthly to roll up compliance totals for management of a subgroup of IHD patients with a 412.nn diagnosis, whose most recent LDL is greater than or equal to 120mg/dl.

This national reminder identifies IHD patients with a documented ICD-9 code 412.nn in the last 5 years, who have had a serum lipid panel within the last two years, where the most recent LDL lab test (or documented outside LDL) is greater than or equal to 120 mg/dl.

If a more recent record of an UNCONFIRMED IHD DIAGNOSIS is found, the reminder will not be applicable to the patient.

Findings:
- Finding Item: VA-IHD 412 DIAGNOSIS (FI(1)=RT(75))
- Finding Item: VA-OUTSIDE LDL <100 (FI(3)=RT(35))
- Finding Item: VA-OUTSIDE LDL 100-119 (FI(4)=RT(34))
- Finding Item: VA-OUTSIDE LDL 120-129 (FI(5)=RT(52))
- Finding Item: VA-OUTSIDE LDL >129 (FI(6)=RT(36))
- Finding Item: VA-LDL <100 (FI(7)=RT(49))
- Finding Item: VA-LDL 100-119 (FI(8)=RT(50))
- Finding Item: VA-LDL 120-129 (FI(9)=RT(51))

Priority:

Reminder Description:
Compliance reporting measures the LDL completed within 2 years as defined by the VA External Peer Review Program (EPRP) performance measure and the maximum guideline recommended below:

The VHA/DOD Clinical Practice Guideline for Management of Dyslipidemia recommends that patients with Ischemic Heart Disease have a lipid profile/LDL every one to two years; and that patients taking lipid lowering medications have a lipid profile/LDL at least every year.

This national IHD 412 Lipid Profile Reporting reminder is used monthly to roll up LDL compliance totals for a subgroup of IHD patients. This reminder identifies IHD patients with a documented ICD-9 code 412.nn in the last five years who have not had a serum lipid panel/LDL (calculated or direct lab package LDL or documented outside LDL) within the last two years. If a more recent record of an UNCONFIRMED IHD DIAGNOSIS is found, the reminder will not be applicable to the patient.

Findings:
Finding Item: VA-IHD 412 DIAGNOSIS (FI(1)=RT(75))
Finding Item: VA-LDL (FI(2)=RT(32))
Finding Item: VA-OUTSIDE LDL <100 (FI(3)=RT(35))
Finding Item: VA-OUTSIDE LDL 100-119 (FI(4)=RT(34))
Finding Item: VA-OUTSIDE LDL 120-129 (FI(5)=RT(52))
Finding Item: VA-OUTSIDE LDL >129 (FI(6)=RT(36))
Finding Item: VA-UNCONFIRMED IHD DIAGNOSIS (FI(10)=RT(42))
Finding Item: VA-LIPID LOWERING MEDS (FI(12)=RT(54))
Finding Item: VA-LDL <100 (FI(13)=RT(49))
Finding Item: VA-LDL 100-119 (FI(14)=RT(50))
Finding Item: VA-LDL 120-129 (FI(15)=RT(51))
Finding Item: VA-LDL >129 (FI(16)=RT(71))

FI(VA-OUTSIDE LDL 120-129)!FI(VA-OUTSIDE LDL >129)
Usage: DATA EXTRACT, REPORTS

Reminder Description:
Compliance reporting measures the management of IHD patients whose most recent LDL is greater than or equal to 120mg/dl as defined by the VA External Peer Review Program (EPRP) performance measure and the maximum guideline recommended below:

The VHA/DOD Clinical Practice Guideline for Management of Dyslipidemia recommends an LDL goal of <120 mg/dl for patients with Ischemic Heart Disease; and the NCEP Adult Treatment Panel II recommends a more stringent goal of <100 mg/dl.

This national IHD Elevated LDL Reporting reminder is used monthly to roll up compliance totals for management of IHD patients whose most recent LDL is greater than or equal to 120mg/dl.

This national reminder identifies patients with known IHD (i.e., a documented ICD-9 code for IHD in the last five years) who have had a serum lipid panel within the last two years, where the most recent LDL lab test (or documented outside LDL) is greater than or equal to 120 mg/dl. If a more recent record of an UNCONFIRMED IHD DIAGNOSIS is found, the reminder will not be applicable to the patient.

Findings:
Finding Item: VA-IHD DIAGNOSIS (FI(1)=RT(27))

FI(VA-LDL)!FI(VA-OUTSIDE LDL <100)!FI(VA-OUTSIDE LDL 100-119)!FI(VA-OUTSIDE LDL 120-129)!FI(VA-OUTSIDE LDL >129)
Reminder Description:
Patients who served in combat in either Operation Iraqi Freedom (Iraq, Kuwait, Saudi Arabia, Turkey) or in Operation Enduring Freedom (Afghanistan, Georgia, Kyrgyzstan, Pakistan, Tajikistan, Uzbekistan, The Philippines) should be screened for illnesses related to their service. Screening for PTSD, depression, problem alcohol use, infectious diseases, and chronic symptoms should be part of the initial evaluation of these Veterans.

COHORT: Veterans with separation date after 9/11/01. This finding is part of the reminder term: VA-IRAQ/AFGHAN PERIOD OF SERVICE and is determined by a computed finding.

An additional reminder term VA-ACTIVE DUTY is also available to cause patients to be part of the cohort. This term contains a computed finding for VA-PATIENT TYPE which can be used to include active duty patients. Sites that do not screen active duty patients may remove the computed finding from this reminder term.

RESOLUTION: entry of a health factor for NO IRAQ/AFGHAN SERVICE which is found in the reminder term IRAQ/AFGHAN SERVICE NO will resolve the reminder. If the Veteran served in Iraq or Afghanistan (IRAQ/AFGHAN SERVICE) then

1. the area of service by country must be answered and 2. all the other items are required to resolve the reminder and must be completed after the date of the most recent service separation:
   a) screen for PTSD,
   b) screen for depression,
   c) screen for alcohol use,
   d) all 4 screening questions related to infectious diseases and other symptoms.

The clinical maintenance will display information on which portions of the screen are not yet completed.

All of the individual elements of the screening tool are exported with attached health factors and reminder terms. The national health factors and reminder terms for the 2 question depression screen are used for the depression screening. The reminder dialog for alcohol screening allows the use of the standard AUDIT-C tool from the Mental Health package or entry of a refusal or entry of a health factor for no alcohol in the past year. The reminder term for ALCOHOL USE SCREEN contains the AUDIT-C and CAGE from the Mental Health package, the health factor for no alcohol use in the past year and the health factor for refusal. Additional health factors are included for PTSD screening and for the Infectious Diseases/Chronic symptoms screening. If your site does PTSD screening, then you will need to map your local health factors to the national PTSD reminder terms that are exported with this reminder.

The HFs for all of these screens should be entered in the site parameters as ones that cannot be added outside of a reminder dialog. Use the parameter ORWFC EXCLUDE HEALTH FACTORS to exclude these from the electronic encounter forms. Entry of these health factors should ONLY
occur during reminder dialog use.

Findings:

REMINDER DEFINITION LIST

Name: VA-AAA SCREENING
Print Name: Screen for Abd Aortic Aneurysm
Class: NATIONAL
Sponsor: National Clinical Reminder Committee
Review Date:
Usage: CPRS, DATA EXTRACT, REPORTS
Priority:
Reminder Description:
Screen once for AAA in men ages 65-75 who are current or prior smokers.

Developed by the National Clinical Reminder Committee in conjunction with the VA National Center for Health Promotion and Disease Prevention and Dr. Charles Anderson, Director, VHA Radiology Program.

The reminder applies to all patients who have a history of smoking recorded in their record. Mapping of all local health factors for current or prior smoking history is needed. The term VA-SMOKING HISTORY is included for this. The user has an option in the dialog to indicate that the patient smoked <100 total lifetime cigarettes.

If the procedure was done on or after the 60th birthday, then it will be counted as adequate screening.

Many types of imaging procedures could be adequate to evaluate the status of the abdominal aorta if the interpreting Radiologist addresses the aorta in the reading and the report. Because it is not always clear from...
the type of procedure, these procedures are marked as "non-specific" abdominal imaging in this reminder and a health factor is available to be entered by a user if it is clear from the report that the procedure adequately addressed the status of the abdominal aorta from the renal arteries to the bifurcation of the aorta.

The following terms are included: VA-IMAGING FOR AAA (CPT NON-SPECIFIC PROC) This term is mapped to a taxonomy of procedures that represent radiology studies that could be adequate for screening but may not be depending on the report.

VA-IMAGING FOR AAA (RAD NON-SPECIFIC PROC) This term must be mapped locally and should contain radiology procedures ONLY. No CPT codes should be added to this term. If a diagnostic code is added by Radiology to one of the procedures in this term to show that AAA screening was completed, then the reminder will be resolved.

VA-IMAGING FOR AAA (RAD SPECIFIC PROC) This term must be mapped locally and should contain radiology procedures ONLY. No CPT codes should be added to this term. Only procedures that are always used to screen for AAA should be added to this term. Do not enter any procedures that may be done for purposes other than AAA screening. This term will resolve the reminder.

A reminder term for orderable items is included. You will need to map your local orderable items for the procedures in the taxonomy to this term in order for orders to temporarily resolve the reminder. If a procedure has been ordered in the past 6 months, then this finding will temporarily resolve the reminder. If a different time period is preferable at the local VA, then enter a different date range on the findings in this term and those dates will override the 6 month period.

A health factor for outside procedures is included.

Patients with a short life expectancy are excluded. You may want to add any local health factors for short life expectancy to the reminder term VA-AAA SCREENING NOT APPLICABLE.

Patients who are not candidates for repair may not be appropriate for screening and may be excluded.

Patients with known AAA or with prior repair of an AAA are excluded.

A term is included for refusals and this term permanently resolves the reminder. If a shorter time frame is desired for refusal, then enter that time frame on the health factor in the term.

Findings:

Finding Item: VA-SMOKING HISTORY (FI(1)=RT(793))

Print Name: High Risk MH No-Show Follow-up
Class: NATIONAL
Sponsor: Office of Mental Health Services
Review Date:
Rescission Date:
Usage: CPRS, DATA EXTRACT, REPORTS
Related VA-* Reminder:
Reminder Dialog: VA-MH HIGH RISK NO SHOW FOLLOW-UP
Priority:

Description:
This reminder shall determine whether Mental Health (MH) professionals have followed up on a No-Show MH appointment for a patient with an active High Risk for Suicide Patient Record Flag.

The reminder requires clinicians to initiate follow-up with the patient to insure his/her safety and to try to get the patient back into care. The follow-up results are documented with health factors.

Studies show that individuals that get lost to follow-up have a higher rate of actual suicide than those that stay connected with care.

If the patient has a completed encounter to a MH appointment on the same day, or within 72 hours of the missed MH appointment, follow-up will no longer be necessary.

Technical Description:

Baseline Frequency:

Do In Advance Time Frame: Do if DUE within 99Y - Once
Sex Specific: Ignore on N/A:
Frequency for Age Range: 99Y - Once for all ages
Match Text: Reminder triggered by missed MH appointment and when resolved won’t be due again until another missed MH appointment occurs. \\

Select Reminder Definition:
**Integrity Check Options**

Two new options were added to the reminder definition management menu: Integrity Check Selected and Integrity Check All. These can be used to check the integrity of selected or all reminder definitions. The integrity check will also be made automatically whenever a reminder definition has been edited. Fatal errors (F) that will prevent the reminder from working properly and warnings (W) will be given. The following checks are made:

F – Each finding is checked to make sure it exists

F – If either the Beginning Date/Time or Ending Date/Time contains FIEVAL(M,”DATE”) or FIEVAL(M,N,”DATE”), the definition is checked to make sure it contains finding M, and if an occurrence is used, the Occurrence Count of finding M is checked to make sure it is greater than or equal to N.

F – Function findings functions of the form FUNCTION(M) and FUNCTION(M,N) are checked to make sure finding M is in the definition and the Occurrence Count of finding M is greater than or equal to N.

F – If a Custom Date Due is defined, it is checked to make sure that the findings used in the Custom Date Due all exist in the definition.

F – Patient Cohort Logic and Resolution Logic are checked to make sure that the findings used in the logic all exist in the definition.

F – Logic strings are checked to make sure their syntax is valid.

F – The definition contains Resolution Logic but does not have a baseline frequency or any findings that will set a frequency.

W – The Usage field contains a “P” and it is not a national reminder

W – The definition contains Resolution Logic but does not have a baseline frequency. It does have findings that will set a frequency. This could be a problem if all findings that set frequency are false.

NOTE: PXRM*2*26 added new checks:
- When the Usage is ‘L’, any computed findings that are not list-type are flagged as fatal errors.
- Terms that are used as findings in the definition will now be checked to make sure all the mapped findings exist and mapped computed findings are the proper type.

**Integrity Check Selected**

This option lets the user select a reminder definition for integrity checking.

```
Select Reminder Definition Management Option: ICS Integrity Check Selected
Select Reminder Definition: VA-TERATOGENIC MEDICATIONS ORDER CHECK NATIONAL
Warning, there is no Resolution logic.
No fatal errors were found.
```
**Integrity Check All**

This option runs the integrity check for all reminder definitions on the system. It is good practice to run this on a regular basis such as monthly or quarterly.

```
Select Reminder Definition Management Option: ica Integrity Check All

Check the integrity of all reminder definitions.
DEVICE: HOME// HOME

Checking 01-DIAB PTS (5Y) W/O DIAB EXAM (1Y) (IEN=256)
Warning, there is no Resolution logic.
No fatal errors were found.

Checking 37-PC-PTSD SCREENING (IEN=331)
No fatal errors were found.

Checking 691 PNT EYE CLINIC (IEN=262)
Warning, there is no Resolution logic.
No fatal errors were found.

Checking AAA SCREENING (IEN=360)
No fatal errors were found.

Checking AGETEST (IEN=660004)
No fatal errors were found.

Checking AGP ABNORMAL WH STUFF (IEN=170)
Finding number 10 uses computed finding VA-PROGRESS NOTE. This computed finding
will not work properly unless the Computed Finding Parameter is defined and in this case it is not.
Finding number 13 uses computed finding VA-ACTIVE PATIENT RECORD FLAGS. This computed finding will not work properly unless the Computed Finding Parameter is defined and in this case it is not.

Checking AGP APPOINTMENT (IEN=419)
Finding number 1 uses computed finding VA-APPOINTMENTS FOR A PATIENT. This computed finding will not work properly unless the Computed Finding Parameter is defined and in this case it is not.

Etc.
```
## Reminder Definition Fields

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME</td>
<td>This field is the name of a clinical reminder definition. Nationally distributed reminder definition names are prefixed with &quot;VA-&quot;. The VA-prefixed reminder definitions cannot be altered by a site, but may be inactivated so they will not be selectable.</td>
</tr>
<tr>
<td>PRINT NAME</td>
<td>This is the name that is used when the results of a reminder evaluation are displayed.</td>
</tr>
<tr>
<td>CLASS</td>
<td>This is the class of definition. National definitions cannot be edited or created by sites.</td>
</tr>
<tr>
<td>SPONSOR</td>
<td>This is the name of a group or organization that sponsors the reminder.</td>
</tr>
<tr>
<td>REVIEW DATE</td>
<td>The review date is used to determine when the definition should be reviewed to verify that it is current with the latest standards and guidelines.</td>
</tr>
</tbody>
</table>
| USAGE           | This field allows the reminder creator to specify how the reminder can be used. This is a free text field that can contain any combination of the following characters: A - Action  
|                 | C - CPRS (the reminder can be used in the CPRS GUI)  
|                 | L – Reminder Patient List  
|                 | O – Reminder Order Checks  
|                 | P – Patient; patients can view "My Health" reminders; the wildcard (*) excludes P R - Reminder Reports (the reminder can be used in reminder reports)  
|                 | X - Reminder Extracts (the reminder is used for data extraction)  
|                 | * - All of the above, except L, O, and P  
|                 | This field must contain C or * if the reminder is to be selected in CPRS. The L or the O values will override all other values.  
|                 | The A will not allow a reminder to be used on the CPRS coversheet unless the value of C is set also in the usage field.  
|                 | NOTE: To enter more than one code, type the codes with no spaces or punctuation between them.                                                   |
| INACTIVE FLAG   | Reminders that are inactive will not be evaluated. The Clinical Maintenance component will return a message stating the reminder is inactive and the date when it was made inactive.  
<p>|                 | Other applications that use reminders may use this flag to determine if a reminder can be selected for inclusion.                           |
| REMINDER DESCRIPTION | This is a description of the clinical purpose of the reminder.                                                                                |
| TECHNICAL DESCRIPTION | This is a description of how the reminder works.                                                                                 |
| PRIORITY        | The reminder priority is used by the CPRS GUI for sorting purposes.                                                                           |
| DO IN ADVANCE TIME FRAME | This field is used to let a reminder become due earlier than the date determined by adding the frequency to the date when the reminder was last resolved. For example, if the frequency is 1Y (one year) and the DO IN ADVANCE TIME FRAME is 1M (one month) the reminder would have a status of &quot;DUE SOON&quot; 11 months after it was last resolved. After one year has passed the STATUS would be &quot;DUE.&quot; |</p>
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SEX SPECIFIC</td>
<td>This field is used to make a reminder sex-specific. If an &quot;F&quot; is entered, the reminder applies only to females. If an &quot;M&quot; is entered, the reminder applies only to males. If it is left blank, then the reminder is applicable to either sex.</td>
</tr>
<tr>
<td>IGNORE ON N/A</td>
<td>This field allows the user to stop reminders from being printed in the Clinical Maintenance component if the reminder is N/A. This is a free-text field that can contain any combination of the following codes:</td>
</tr>
<tr>
<td></td>
<td>Code Description</td>
</tr>
<tr>
<td></td>
<td>A  N/A due to not meeting age criteria.</td>
</tr>
<tr>
<td></td>
<td>I  N/A due to inactive reminder.</td>
</tr>
<tr>
<td></td>
<td>R  N/A due to the wrong race.</td>
</tr>
<tr>
<td></td>
<td>S  N/A due to the wrong sex.</td>
</tr>
<tr>
<td></td>
<td>*  N/A for any reason.</td>
</tr>
<tr>
<td>FREQUENCY AGE RANGE SET</td>
<td>The Frequency Age Range set is a multiple that allows you to define different frequencies for different non-overlapping age ranges. The fields in this multiple are:</td>
</tr>
<tr>
<td></td>
<td>REMINDER FREQUENCY: This is the frequency to give the reminder. It is input as nD, nM, or nY, where D stands for days, M for months, Y for years, and n is a number. Thus, for a reminder that is to be given once a year, the values 365D, 12M, or 1Y would all work. If a reminder is only to be given once in a lifetime, use a frequency of 99Y.</td>
</tr>
<tr>
<td></td>
<td>MINIMUM AGE: This field specifies the minimum age for defining an age range associated with a frequency. Leave it blank if there is no minimum age.</td>
</tr>
<tr>
<td></td>
<td>MAXIMUM AGE: This field specifies the maximum age for defining an age range associated with a frequency. Leave it blank if there is no maximum age.</td>
</tr>
<tr>
<td></td>
<td>AGE MATCH TEXT: This text will be displayed in the Clinical Maintenance component if the patient's age falls in the age range.</td>
</tr>
<tr>
<td></td>
<td>AGE NO MATCH TEXT: This text will be displayed in the Clinical Maintenance component if the patient's age does not fall in the age range.</td>
</tr>
<tr>
<td>FINDING</td>
<td>The Findings multiple is documented later in this chapter, page 120.</td>
</tr>
<tr>
<td>FUNCTION FINDINGS</td>
<td>Function Findings are new in version 2.0. They are called Function Findings because they do a computation on the results from regular findings. Function Findings can be used in both patient cohort logic and resolution logic. The general form of the function string is:</td>
</tr>
<tr>
<td></td>
<td>FUNCTION(finding list) operator FUNCTION(finding list) where FUNCTION is one of the available functions and finding list is a comma-separated list of regular finding numbers. See page 135.</td>
</tr>
<tr>
<td>CUSTOMIZED PATIENT COHORT LOGIC</td>
<td>This field may be used to define a customized Boolean logic string that defines how and what findings in a reminder are used to determine if the reminder applies to the patient. The customized logic is used when the USE IN PATIENT COHORT LOGIC fields associated with each finding do not provide the ability to create the required logic string. (e.g., grouping various findings within parenthesis)</td>
</tr>
<tr>
<td></td>
<td>Tip: Before defining the Boolean string, review the default logic defined in the DEFAULT PATIENT COHORT LOGIC field using the reminder inquiry option.</td>
</tr>
<tr>
<td>GENERAL PATIENT COHORT FOUND TEXT</td>
<td>This text is displayed in the Clinical Maintenance component if the patient is in the cohort and the reminder is applicable.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>GENERAL PATIENT COHORT NOT FOUND TEXT</td>
<td>This text will be displayed in the Clinical Maintenance component if the patient is not in the cohort and the reminder is not applicable.</td>
</tr>
<tr>
<td>CUSTOMIZED RESOLUTION LOGIC</td>
<td>This field may be used to define a customized Boolean logic string that defines how and what reminder findings are used to determine if the reminder has been resolved. The customized logic is used when the USE IN RESOLUTION LOGIC fields associated with each finding do not provide the ability to create the required logic string. (e.g., grouping various findings within parenthesis). Tip: Before defining the Boolean string, review the default logic defined in the DEFAULT RESOLUTION LOGIC field using the reminder inquiry option.</td>
</tr>
<tr>
<td>GENERAL RESOLUTION FOUND TEXT</td>
<td>This text will be displayed in the Clinical Maintenance component if the reminder has been resolved.</td>
</tr>
<tr>
<td>GENERAL RESOLUTION NOT FOUND TEXT</td>
<td>This text will be displayed in the Clinical Maintenance component if the reminder has not been resolved.</td>
</tr>
<tr>
<td>CUSTOM DATE DUE</td>
<td>When a CUSTOM DATE DUE is defined, it takes precedence over the standard date due calculation. This means the normal date due calculation that is based on the dates of the resolution findings and the final frequency is not done. Only the dates of the findings and the frequencies specified in the Custom Date Due string are used. Any finding that is in the reminder definition can be used in the Custom Date Due string; it is not limited to those defined as resolution findings. The final age range will still be used to determine if the patient is in the cohort; however, the frequency associated with this age range is not used. Only the frequencies specified in the Custom Date Due String are used. They are added to the date of the associated finding to determine the dates used by the MIN_DATE, MAX_DATE, or RANK_DATE functions.</td>
</tr>
<tr>
<td>LINKED REMINDER DIALOG</td>
<td>This is the Reminder Dialog that will be used when the reminder is processed in the CPRS GUI.</td>
</tr>
<tr>
<td>WEB SITES</td>
<td>This multiple contains Web site(s) for information related to this reminder. When processing a reminder in the CPRS GUI you will be able to launch a browser and visit the Web site.</td>
</tr>
<tr>
<td>Select URL</td>
<td>This is the URL for the web site.</td>
</tr>
<tr>

</tbody>
</table>
Reminder Findings

Findings are types of data elements in VistA that determine a reminder’s status. Each finding is evaluated when a reminder is evaluated for a patient. Findings are either True (1) or False (0)

Findings have three functions in reminder definitions:
- To select the applicable patient population (Patient Cohort Logic)
- To resolve the reminder (Resolution Logic)
- To provide information

IMPORTANT: There is a problem with the scoring of some Mental Health instruments, see the discussion and Important Note on page 279.

TIP: When editing findings in a reminder definition or term, you can save time by giving an exact specification of the name of the finding by using the abbreviation. This tells FileMan exactly where to find it and avoids long searches.

Example

  For finding: VA-DIABETES taxonomy
  Enter: TX.VA-DIABETES

Hint: To add a second occurrence of a finding, enclose it in quotes, i.e., “Prefix.Name”

Drug – Drugs are found in the DRUG file #50. Results for individual patients can be found in the Pharmacy Patient file #55 (inpatient), the Prescription file #52 (outpatient), or for non-VA Meds which are stored in the Pharmacy Patient file. The parameter RXTYPE can be used to control which files are searched for patient results; see the description of RXTYPE below.
Each type of drug has an associated start date and stop date. For inpatient drugs, these are the START DATE and the STOP DATE. For outpatient drugs, the start date is the RELEASE DATE and the stop date is the RELEASE DATE + DAYS SUPPLY. For non-VA Meds, the start date is the START DATE or, if there is no START DATE, it is the DOCUMENTED DATE and the stop date is the DISCONTINUED DATE if it exists; otherwise it is today’s date.

**Education Topic** – Education topics are found in the EDUCATION TOPICS file #9999999.09. Results for individual patients are found in the V PATIENT ED file #9000010.16. The default value used for the CONDITION is LEVEL OF UNDERSTANDING. Possible values are:
- '1' FOR POOR;
- '2' FOR FAIR;
- '3' FOR GOOD;
- '4' FOR GROUP-NO ASSESSMENT;
- '5' FOR REFUSED

If you want to allow only those educations where the LEVEL OF UNDERSTANDING is GOOD to be true, the CONDITION field would be I V=3.

**Exam** – Exams are found in the EXAM file #9999999.15. Results for individual patients are found in the V EXAM file #9000010.13. The default value used for the CONDITION is the RESULT. Possible values are:
- 'A' FOR ABNORMAL
- 'N' FOR NORMAL

If you want only those exams where the RESULT is NORMAL to be true, the CONDITION field would be I V="N".

**Health Factor** – Health factors are found in the HEALTH FACTOR file #9999999.64. Results for individual patients are found in the V HEALTH FACTOR file #9000010.23. The default value used for the CONDITION is LEVEL/SEVERITY. Possible values are:
- 'M' FOR MINIMAL
- 'MO' FOR MODERATE
- 'H' FOR HEAVY/SEVERE

If you want only those health factors whose LEVEL/SEVERITY is HEAVY/SEVERE to be true, then the CONDITION field would be I V="H".

Health Factors have a field called ENTRY TYPE. There are two possible values for this field: category and factor. Each factor health factor must belong to a category. Categories provide a way to group health factors. Typical examples of categories are alcohol use, breast cancer, and tobacco. When reminders are evaluated, if there is more than one health factor from a category in the definition, only the most recent health factor in the category can be true. This feature can be used to make a reminder applicable or not applicable for a patient.

**Example:**
A reminder for smoking cessation education provides a good example. A health factor of current smoker is used in the PATIENT COHORT LOGIC with the AND Boolean operator. A second health factor of non-smoker is included as an information finding. A patient comes in and is a current smoker so they are given the current smoker health factor; this makes the reminder applicable. The patient has the smoking cessation education; six months later he or she has quit, so is given the non-smoker health factor. Since
non-smoker is more recent than current smoker, the reminder is not applicable. Another six months passes and the patient is smoking again, so he is given the current smoker health factor, which makes the reminder applicable again. All the health factors are still in the patient’s record, so you can see the progression of their smoker non-smoker status.

When health factors are mapped to a Term, the categorization is done only for the health factors in the Term. The Term factors are not combined with health factors in the definition for the categorization.

The field WITHIN CATEGORY RANK will let you change this categorization behavior. See that section, page 122, for a description of how to use it.

Only those Health Factors with an ENTRY TYPE of factor can be used in reminder definitions. However, when you create a packed reminder definition using the reminder Exchange Utility, each factor health factor and its category health factor are included. This is done so that a receiving site can install the factor health factors used in the reminder definition. Factor health factors cannot be installed if their category health factor does not already exist. Category health factors should be installed before factor health factors.

**Immunization** – Immunizations are found in the IMMUNIZATION file #9999999.14. Results for individual patients are found in the V IMMUNIZATION file #9000010.11. The default value used for the CONDITION is the SERIES. Possible values are:
- 'P' FOR PARTIALLY COMPLETE
- 'C' FOR COMPLETE
- 'B' FOR BOOSTER
- '1' FOR SERIES 1
- '2' FOR SERIES 2
- '3' FOR SERIES 3
- '4' FOR SERIES 4
- '5' FOR SERIES 5
- '6' FOR SERIES 6
- '7' FOR SERIES 7
- '8' FOR SERIES 8

**Laboratory Test** – Laboratory tests are found in the LABORATORY TEST file #60. Only individual tests may be selected as a reminder finding; lab panels cannot be used. Test results are found in the LAB DATA file #63. The default value for the CONDITION is the result of the lab test. The type of result, text or numerical, the normal range of values, and the units will be a function of the particular test, so you should be aware of what they are before you set up a Condition.

**Orderable Item** – Orderable Items are found in the ORDERABLE ITEMS file #101.43. Results for a patient are found in the ORDER file #100. An order has an associated Start Date and in most – but not all – cases, an associated Stop Date. If the Stop Date does not exist, then reminder evaluation date is used as the Stop Date. By default, Start Date is used as the date of an orderable item finding. If you want the date of the finding to be the Stop Date, set the finding modifier to NO. See the description of the USE START DATE finding modifier to understand how date ranges are used in the finding search.

You can use a STATUS LIST for orderable item findings. If no STATUS LIST is defined, then only orders with a status of active or pending can be true. The default value for the CONDITION is the order status.
Possible order statuses are found in the ORDER STATUS file #100.01:

- DISCONTINUED
- COMPLETE
- HOLD
- FLAGGED
- PENDING
- ACTIVE
- EXPIRED
- SCHEDULED
- PARTIAL RESULTS
- DELAYED
- UNRELEASED
- RENEWED
- DISCONTINUED/EDIT
- CANCELLED
- LAPSED
- NO STATUS

In Clinical Reminders V.1.5, an OE/RR API was used to obtain order information and it always returned the order status in lower-case. Clinical Reminders V.2.0 uses the Clinical Reminders Index to determine if a patient has a particular orderable item and a new API to obtain the actual order data. This new API returns the order status in all upper-case.

**MH Tests and Surveys** – This file defines the interviews, surveys and tests available in the Mental Health Assistant. Attributes of the instruments include authoring credits, target populations, normative samples and copyright information. Actions available including privileging, reporting of full item content and transmission to the Mental Health National Database are also specified.

Entries may be made through the provided Mental Health Authoring software. Direct entry through FileMan or the programmer prompt is prohibited.

Mental Health Instruments are found in the MH INSTRUMENT file #601. Results for a patient are found in the PSYCH INSTRUMENT PATIENT file #601.2. The default value for the CONDITION is the result returned by the Mental Health test. The normal range of values and the units will be a function of the particular test. When the user enters answers to a mental health test, the answers are automatically passed to the Mental Health package to calculate a result, which may be referenced as SCORE. For example, CAGE test has a SCORE from 1-4 and GAF has a SCORE from 1-99.

For most Mental Health tests, progress note text can be automatically generated that summarizes or includes the results (SCORE). Default text is distributed in the REMINDER DIALOG file # 801.41 for sites to use for each Mental Health test processed in the reminder resolution process.

Because different Mental Health Score could have possible results, reminder dialogs use Result Group for the score evaluation. A result group can contain multiple result elements. Based on the Mental Health test score, the correct Result element Text is displayed in the progress note. To modify the default text, sites would need to copy both the Result Element and the Result group. The progress note text is contained in the result element. The modified result element must be added to the local result group alone, with any other result element to be evaluated against when the Mental Health test is processed in the Reminder Dialog. Once the result group is completed, it must be added to the Dialog element that contains the Mental Health dialog. Sites would add the new Result group to this field: RESULT GROUP/ELEMENT.

**Reminder Computed Findings** – Reminder Computed Findings are found in the COMPUTED FINDINGS file #811.4. Computed findings provide the ability to create custom findings for situations when none of the standard findings will work.

See the chapter on Computed Findings, page 24, for more details.

**Reminder Taxonomy** – Reminder taxonomies are found in the REMINDER TAXONOMY file #811.2. Reminder taxonomies provide a convenient way to group coded values and give them a name. For example, the VA-DIABETES taxonomy contains a list of diabetes diagnoses.
A taxonomy can contain ICD0, ICD9, and CPT codes. The codes are entered as a low value and a high value. These pairs are automatically expanded into a set that contains the low value, the high value, and every code in between. Clinical Reminders searches in a number of places for code matches. For ICD9 codes, it looks in V POV, Problem List, and PTF. For CPT codes, it looks in V CPT and Radiology. For ICD0 codes, it looks in PTF.

There are two dates associated with ICD9 diagnoses found in Problem List, the date entered and the date last modified. The PRIORITY field is used to determine if a problem is chronic or acute. If the problem is chronic, Clinical Reminders will use today’s date in its date calculations; otherwise it will use the date last modified. The default is to only use active problems unless the field USE INACTIVE PROBLEMS is yes or the STATUS LIST contains the status of inactive.

The following are fields that can be specified for each taxonomy finding:

USE INACTIVE PROBLEMS – Normally, Problem List problems that are marked as inactive are ignored during the reminder evaluation. If you want them to be used, give this field a value of “YES.”

PATIENT DATA SOURCE specifies where to search for patient data. It is a string of comma-separated key words. The keywords and their meanings are:

<table>
<thead>
<tr>
<th>KEYWORD</th>
<th>MEANING</th>
</tr>
</thead>
<tbody>
<tr>
<td>IN</td>
<td>Search in the inpatient data file PTF</td>
</tr>
<tr>
<td>INDXLS</td>
<td>Search in PTF for DXLS only</td>
</tr>
<tr>
<td>INPR</td>
<td>Search in PTF for principal diagnosis only</td>
</tr>
<tr>
<td>EN</td>
<td>Search encounter (PCE) data</td>
</tr>
<tr>
<td>ENPR</td>
<td>Search PCE data for primary diagnosis only</td>
</tr>
<tr>
<td>PL</td>
<td>Search for Problem List diagnosis only</td>
</tr>
<tr>
<td>RA</td>
<td>Search in Radiology for radiology CPT codes.</td>
</tr>
</tbody>
</table>

You may use any combination of these keywords. An example is EN,RA. This would cause the search to be made in V CPT and Radiology for CPT codes. If PATIENT DATA SOURCE is left blank, the search is made in all the possible sources.

See the chapter that describes Reminder Taxonomy options on page 157.

Reminder Term – Reminder Terms are found in file #811.5. Reminder Terms provide a way to define a general concept, for example diabetes diagnosis, which can be mapped to specific findings. A Reminder Term must be mapped to at least one finding before it can be used for reminder evaluation. A Reminder Term can be mapped to more than one finding. Reminder Terms can be mapped to any of the findings, except Reminder Terms, that can be used in a Reminder Definition.

Each node of the findings multiple in a term has the following fields: BEGINNING DATE/TIME, ENDING DATE/TIME, USE INACTIVE PROBLEMS, WITHIN CATEGORY RANK, CONDITION, MH SCALE, and RXTYPE. These fields work exactly the same as the fields with the same names in the findings multiple of the reminder definition. If one of these fields is specified at the definition findings level, where the term is the finding, then each finding in the term will inherit the value. If the field is specified at the finding level of the term, then it will take precedence and replace what has been specified at the definition level.

See the chapter in this manual that describes Reminder Term options on page 196.
**Skin Test** – Skin Tests are found in the SKIN TEST file #9999999.28. Results for individual patients are found in the V SKIN TEST file #9000010.12. The default value used for CONDITION is RESULTS.

Possible values are:
- 'P' FOR POSITIVE
- 'N' FOR NEGATIVE
- 'D' FOR DOUBTFUL
- 'O' FOR NO TAKE

If you want only those findings to be true for skin tests whose results are positive, the CONDITION would be I V="P".

**VA Drug Class** – VA Drug Class entries are found in the VA DRUG CLASS file #50.605. An entry from the VA Drug Class file points to one or more entries in the Drug file. Each of the corresponding entries in the Drug file is processed as described in the Drug section. The information displayed in the Clinical Maintenance component includes the VA Drug Class and the particular drug that was found.

**VA Generic** – VA Generic entries are found in the VA GENERIC file #50.6. (This was formerly called the National Drug file.) An entry from the VA Generic file points to one or more entries in the Drug file.

Each of the corresponding entries in the Drug file is processed as described in the Drug section. The information displayed in the Clinical Maintenance component includes the VA Generic name and the particular drug that was found.

**Vital Measurement** – Vital Measurement types are found in the GMRV VITAL TYPE file #120.51. Results for individual patients are found in the GMRV VITAL MEASUREMENT file #120.5. The default value used for the CONDITION is RATE, which is the value of the measurement. If you are going to use a CONDITION with this finding, you need to be familiar with how the Vitals package returns the Rate data. For example, if the vital sign is weight, Rate will be a number that is the weight in pounds. If the vital sign is blood pressure, then Rate can have two possible forms: systolic/diastolic or systolic/intermediate/diastolic. If your Condition is to be based only on systolic pressure, then it is straightforward; you always check the first piece. For example, if you want the finding to be true only for systolic pressures greater than 140, then the Condition would be I $P(V,"/",1)>140. Checking the diastolic pressure is not so straightforward because there is no way to know in advance whether the Rate will be returned as systolic/diastolic or systolic/intermediate/diastolic. Insuring that you are always checking the diastolic requires the complex Condition statement I SS($L(V,"/")=3:$P(V,"/",3),1:$P(V,"/",2)).

NOTE: Blood pressure is the only Vital measurement for which the Rate can have two possible forms.

PXRM*2*18 Update:
If you are using $P in a Condition, we recommend that you replace it with the appropriate CSUBs.
Several national definitions and terms were originally distributed with Conditions using $P; as part of this patch, they will be updated to use the SYSTOLIC and DIASTOLIC CSUBs.

SYSTOLIC/MEAN/DIASTOLIC and use of CSUB instead of $P: The Clin2 support team pointed out that the value for blood pressure can come back in either of the following forms:
SYSTOLIC/DIASTOLIC or SYSTOLIC/MEAN/DIASTOLIC (the second form is not very common). If the second form comes back, then the DIASTOLIC CSUB would have the value for mean, and if $P was used in a Condition, it would also be the mean. The code was changed so that the DIASTOLIC CSUB will always have the correct value.
Reminder Location List – Reminder Location List entries are found in the REMINDER LOCATION LIST file #810.9. This file contains lists of stop codes and/or hospital locations for use as a reminder finding. Results for individual patients are found by looking at the patient’s Visit file entries and matching the location associated with a Visit with a location in the location list. See the chapter in this manual, page 204, that describes Reminder Location List options.

Finding Modifier Fields

There are a number of fields in the Findings multiple that modify how each Finding is used in the reminder evaluation process. Each of these fields is described in detail below. Some fields apply only to specific finding types and you will only be prompted for them if they apply to the selected finding item.

- FINDING ITEM
- REMINDER FREQUENCY
- MINIMUM AGE
- MAXIMUM AGE
- RANK FREQUENCY
- USE IN RESOLUTION LOGIC
- USE IN PATIENT COHORT LOGIC
- BEGINNING DATE/TIME
- ENDING DATE/TIME
- OCCURRENCE COUNT
- USE INACTIVE PROBLEMS (applies only to taxonomies that search Problem List)
- WITHIN CATEGORY RANK (applies only to health factors)
- MH SCALE (applies only to mental health instruments)
- RXTYPE (applies only to drug findings)
- CONDITION
- CONDITION CASE SENSITIVE
- USE STATUS/COND IN SEARCH
- FOUND TEXT
- NOT FOUND TEXT
- STATUS LIST (applies only to findings that have a status)
- COMPUTED FINDING PARAMETER (applies only to computed findings)

Finding Modifiers Description

REMINDER FREQUENCY, MINIMUM AGE, and MAXIMUM AGE – These are treated as a set that we can call a frequency age range set. If a finding is true, then the frequency age range set will override the baseline frequency age range set. This is used when a finding should override the baseline. For example, a patient with a particular health factor needs to get the reminder at an earlier age than normal and it should be done more frequently. The values these fields can take are exactly the same as those that set the baseline frequency and age range.

RANK FREQUENCY – If more than one finding that has a frequency age range set is true, then how do we decide which frequency age range set to use? That is the purpose of the RANK FREQUENCY. The frequency age range set from the finding with the highest RANK FREQUENCY will be used. In the absence of RANK FREQUENCY, the frequency age range set that will cause the reminder to be given the most often will be used. RANK FREQUENCY is a numerical value with 1 being the highest.
USE IN RESOLUTION LOGIC – This field specifies how a finding is used in resolving a reminder. It is a set of codes that can contain the Mumps Boolean operators and their negations. The operators are ! (OR), & (AND), !’ (OR NOT), and ’ &’ (AND NOT). If a particular finding must be true in order for the reminder to be resolved, then you would use an AND in this field. If the finding is one of a number of findings that will resolve a reminder, then you would use an OR. For those cases where this mechanism does not allow you to describe the exact logical combination of findings you require, you can input the logic directly in the CUSTOM RESOLUTION LOGIC field.

USE IN PATIENT COHORT LOGIC – This field specifies how a finding is used in selecting the applicable patient population; i.e., the patient cohort. It is a set of codes that works exactly like the USE IN RESOLUTION LOGIC. For those cases where this mechanism does not allow you to describe the exact logical combination of findings you require, you can input the logic directly in the CUSTOM PATIENT COHORT LOGIC field.

BEGINNING DATE/TIME – This is the beginning date/time to search for findings.
1. The date/time cannot be in the future.
2. The date/time can be any of the acceptable FileMan date/time formats or abbreviations.
3. In addition, you may use the abbreviations T-NY or NOW-NY, where N is an integer and Y stands for years.
4. If this is null, then the beginning date/time will correspond with the date/time of the oldest entry.

See the FileMan Getting Started Manual to learn about acceptable FileMan date/time formats and abbreviations.

ENDING DATE/TIME – This is the ending date/time to search for findings.
1. The date/time cannot be before the beginning date/time.
2. The date/time can be any of the acceptable FileMan date/time formats or abbreviations.
3. In addition you may use the abbreviations T-NY or NOW-NY, where N is an integer and Y stands for years.
4. If this is null then the ending date/time will be the end of today.

When date range searching is done, a finding with a single date is considered to be in the date range if the date of the finding falls anywhere in the date range defined by the BEGINNING DATE/TIME and ENDING DATE/TIME. The criteria for findings with a start date and a stop date are different. In this case, if there is any overlap between the date range defined by the start date and stop date and the date range defined by the BEGINNING DATE/TIME and the ENDING DATE/TIME, the finding is considered to be in the date range.

* Changes to Beginning and Ending Date/Time made in Patch 18

New functionality was added to allow using the date of one finding to set the date range of another finding. The syntax for the date of a finding is FIEVAL(M,"DATE") or FIEVAL(M,N,"DATE"), where M is the finding number and N is the occurrence. This means you can now use dates like FIEVAL(3,"DATE")-3W as the Beginning or Ending Date/Time of another finding. The global reminder dates PXRMDOB and PXRMLAD can also be used. Note that if FIEVAL(M) is false or PXRMLAD does not exist, then the finding whose date range depends on the date of finding M will be set to false.

In conjunction with allowing FIEVAL(M,N,"DATE") to be used in Beginning Date/Time or Ending Date/Time, additional frequency units were added. The allowed values are now: H (hours), D (days),
W (weeks), M (months), and Y (years). This change applies everywhere that a frequency can be used, including Beginning Date/Time, Ending Date/Time, Reminder Frequency in the Baseline Age Findings multiple, Findings multiple, Function Findings multiple, and Custom Date Due. Custom Date Due will now allow both “+” and “-“; in the past it only allowed “+”.

OCCURRENCE COUNT - This is the maximum number of occurrences of the finding in the date range to return. If the OCCURRENCE COUNT is input as a positive number, N, up to N of the most recent occurrences will be returned and the finding will take the value of the most recent occurrence. If the OCCURRENCE COUNT is input as a negative number then this behavior is reversed. Up to N of the oldest occurrences will be returned and the finding will take the value of the oldest occurrence in the list.

USE INACTIVE PROBLEMS – This field applies only to taxonomies containing ICD 9 diagnoses. If the diagnosis is found in the PROBLEM LIST and it is inactive, then the finding cannot be true unless this field is set to YES.

WITHIN CATEGORY RANK – This field applies only to health factors. In order to understand how it works, you need to understand how health factors work in the reminder evaluation process. The default behavior is that all the health factor findings in the definition are grouped by category and only the most recent health factor in a category can be true. A problem can arise if there are two or more health factors in the same category and they have exactly the same date and time. (This can happen if multiple health factors are given during the same encounter.) If the date/times are the same, the health factor with the highest WITHIN CATEGORY RANK will be the true one. This is a numerical value like RANK FREQUENCY with 1 being the highest rank.

In some cases, you may want to have a health factor treated as an individual finding, suppressing the category behavior. To do this, use the special value of 0 for the WITHIN CATEGORY RANK.

MH SCALE – This is applicable only to Mental Health Instrument findings. The scale is used to score the results. Typing a “?” at the MH SCALE prompt will list all the scales that are applicable for the selected mental health test. Select the scale to use by typing its number. If no scale is selected then the first scale for the test will be used.

Patch 6 Changes:
To aid sites in making the conversion of Clinical Reminders to use MHA3, the post-init will convert all existing mental health findings to their MHA3 equivalent and MH SCALE values to the appropriate MHA3 scale. If the field MH SCALE is null, then the score for the first scale returned by MHA3 will be displayed in the Clinical Maintenance output.

When MH SCALE has a value, it will set the value of V for use in a Condition. In other words, V will be the score according to the scale stored in MH SCALE. Another change is that score is now returned as raw score^transformed score. Thus, if your Condition uses the raw score, you will use +V or $P(V,U,1) and if it uses the transformed score, use $P(V,U,2). The post-init will convert V to +V in all existing national Conditions for MH findings.

The entire set of scores has been made into a CSUB item in patch PXRM*2*6, so that any score or combination of scores can be used in a Condition. For example, the MH Test AUIR has scales 279 through 329; if you want to use the raw score for scale 300, then you can use +V(“S”,300).

USE START DATE – Some findings such as drugs and orderable items have a Start Date and a Stop Date. When these findings are used in the Resolution Logic, determination of a resolution date requires assigning a single date to these types of findings. For drug findings this defaults to the Stop Date while for orderable items it defaults to the Start Date. For findings that have a date range, the finding will be
true if the date range defined by the Start Date to the date of the finding overlaps with the date range defined by the Beginning Date/Time to Ending Date/Time. If USE START DATE is not defined, the date of the finding can be either the Start Date or the Stop Date, as described above. If the date of the finding is set to be the Start Date then the date range for the finding is just Start Date to Start Date.

INCLUDE VISIT DATA – This applies only to the data in the PCE V-files. It includes: V CPT, V EXAM, V HEALTH FACTORS, V IMMUNIZATION, V PATIENT ED, V POV, and V SKIN TEST. When this is set to YES, additional data from the corresponding Visit File entry is included in the list of CSUB data. The best way to determine what additional data is included is by examining the CSUB list shown in reminder test. Adding this data to the CSUB list requires additional computing overhead so set this value to YES only when the additional data is needed; accordingly the default is NO.

RXTYPE - RXTYPE is applicable only to drug findings and controls the search for medications. The possible RXTYPEs are:
- A - all
- I - inpatient
- N - non-VA meds
- O - outpatient

You may use any combination of the above in a comma-separated list. For example, I,N would search for inpatient medications and non-VA meds.

The default is to search for all possible types of medications. So a blank RXTYPE is equivalent to A.

CONDITION – Many types of findings have associated values. For example, for Education Topics, the value is Level of Understanding; for Vital Measurement, it is the value of the measurement. More specific information can be found in the detailed section for each finding type. The CONDITION field can be used to make the finding true or false depending on the value of the finding. The contents of this field are a single line of Mumps code that should evaluate to true or false. If the code evaluates to true, then the finding is true; if it evaluates to false, then the finding is false.

The default value for each finding type is given in the following table.

<table>
<thead>
<tr>
<th>Finding Type</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drug</td>
<td>None</td>
</tr>
<tr>
<td>Education Topic</td>
<td>Level of Understanding</td>

<td>SERVICE CATEGORY</td>
<td>'A' for AMBULATORY 'H' for HOSPITALIZATION 'I' for IN HOSPITAL 'C' for CHART REVIEW 'T' for TELECOMMUNICATIONS 'N' for NOT FOUND 'S' for DAY SURGERY 'O' for OBSERVATION 'E' for EVENT (HISTORICAL)</td>
<td>I V=&quot;A&quot; I V=&quot;H&quot; I V=&quot;I&quot; I V=&quot;C&quot; I V=&quot;T&quot; I V=&quot;N&quot; I V=&quot;S&quot; I V=&quot;O&quot; I V=&quot;E&quot; I V=&quot;R&quot;</td>
</tr>
</tbody>
</table>
In addition to the values for type of finding shown in the above table, the following global reminder variables can be used in any CONDITION:

- PXRMAGE - patient's age
- PXRMDOB - patient's date of birth in FileMan format
- PXRLMD - the last admission date in FileMan format, if there is no admission this will be null
- PXRMSEX - patient's sex, in the format M for male or F for female

The use of these variables is very similar to how you use the V variable. For example, if you want the finding to apply only to patients who are 65 and younger, the CONDITION is I PXRMAGE'>65 (in English if AGE is not greater than 65). You can combine these variables and the V in a CONDITION. Let's say we want a finding that is true for all patients whose BMI>25 and were born before 1955. Our finding is the VA-BMI finding, so the CONDITION is (I V>25)&(PXRMDOB<2550101).

When using PXRMSEX in a CONDITION, you can test for male patients with PXRMSEX="M” and for female patients with PXRMSEX="F”. If we wanted to make the above example true only for female patients the CONDITION would be (I V>25)&(PXRMDOB<2550101)&(PXRMSEX="F”).

In addition to the default values for finding type, which are referred to as V in the Condition statement, you can now use subscripted V values.

Examples:
- I V("PDX")="ABNORMALITY"
- I (V="COMPLETE")&(V("PDX")="ABNORMALITY")
- I V("DATE READ")<V("DATE")

The subscripts that can be used depend on the type of finding; the easiest way to determine what is available is to use the Reminder Test option and examine the FIEVAL array for the finding of interest.

Here is an example where the finding is an Education Topic.

```
FIEVAL(2)=1
FIEVAL(2,1)=1
FIEVAL(2,1,"COMMENTS")=
FIEVAL(2,1,"CSUB","COMMENTS")=
FIEVAL(2,1,"CSUB","LEVEL OF UNDERSTANDING")=1
FIEVAL(2,1,"CSUB","VALUE")=1
FIEVAL(2,1,"CSUB","VISIT")=3102
FIEVAL(2,1,"DAS")=83
```
Each array element that contains a “CSUB” (Condition Subscript) element can be used in a Condition statement, so for this finding, we could use V("COMMENTS"), V("LEVEL OF UNDERSTANDING"), V("VALUE"), or V("VISIT") in the Condition.

Some finding types may return multiple values for certain types of data; an example is qualifiers for vitals. In the Reminder Test Option output for a weight finding you might see qualifiers such as:

- FIEVAL(1,"QUALIFIER",1)=ACTUAL
- FIEVAL(1,"QUALIFIER",2)=STANDING

You could use these in a Condition as follows:

\[ I \left( V("QUALIFIER",1)="ACTUAL" \right) \text{ AND } \left( V("QUALIFIER",2)="STANDING" \right) \text{ AND } (V>165) \]

Since you don’t always know what subscript the various qualifiers will be associated with, you can use the wildcard in the Condition as follows:

\[ I \left( V("QUALIFIER","*")="ACTUAL" \right) \text{ AND } \left( V("QUALIFIER","**")="STANDING" \right) \text{ AND } (V>165) \]

Lab results now include specimen, so that specimen can be used in the Condition statement. For example, I V("SPECIMEN")="SERUM." Again, the best way to find out what is available for a particular finding is to using the Reminder Test Option and see what comes back with a "CSUB" subscript.

CONDITION CASE SENSITIVE. When this field is set to "NO" then the CONDITION will not be case-sensitive. The default is case-sensitive.

USE STATUS/COND IN SEARCH - Give this field a value of "YES", the default is “NO”, if you want the STATUS LIST and/or CONDITION applied to each result found in the date range for this finding. Only results that have a status on the list or for which the CONDITION is true will be retained. The maximum number to retain is specified by the OCCURRENCE COUNT. For example, if there are 7 occurrences of the finding in the date range, occurrences 1, 3, 6, and 7 have a status on the list, and the OCCURRENCE COUNT is 3 then occurrences 1, 3, and 6 will be returned. If USE STATUS/COND IN SEARCH is NO and the OCCURRENCE COUNT is 3 then findings 1, 2, and 3 will be returned but only finding 1 and 3 will be true.

Note - if the finding has both a STATUS LIST and a CONDITION the status check will be made first; the CONDITION will be applied only if the finding passes the status check.
FOUND TEXT – This is a word-processing field. The contents of this field will be displayed in the Clinical Maintenance component whenever the finding is found (true).

NOT FOUND TEXT – This is a word-processing field. The contents of this field will be displayed in the Clinical Maintenance component whenever the finding is not found (false).

Both FOUND TEXT and NOT FOUND TEXT can contain TIU objects. In both, you can control the output format by using \ to force a line break.

Both FOUND TEXT and NOT FOUND TEXT can contain TIU objects and CSUB objects. See the Found Text/Not Found Text Details section for more information.

STATUS LIST - This field applies to finding types that have an associated status. When the search for patient findings is done, only those findings that have a status on the list can be true. The allowable values depend on the finding type. If no statuses are specified then the default list for each finding type will be used.

COMPUTED FINDING PARAMETER - This field applies only to computed findings and is used to pass a parameter into the computed finding. Acceptable values for this field depend on the computed finding and should be documented in the computed finding description.

Found Text/Not Found Text Details

Normally, all Found/Not Found Text is formatted before it is output. The formatting includes combining short lines to create output that uses the full available width and the use of the double backslash (\\) to force a line break. For example, if the Found Text contained this text:

This shows how the formatter combines lines.

When it is formatted for the Clinical Maintenance Output, it becomes:

This shows how the formatter combines lines.

In some cases, this may not be desirable (For example, when a TIU Health Summary Object is included in the Found/Not Found Text and you want it displayed exactly like it is in a health summary.) When this is the case, enclose the text that you do not want formatted in a not-format block. The not-format block starts with ‘FMT{ and ends with }FMT. You can think of it mnemonically as, “do not format the text that is in the block”.

Here are some example of how to use the not-format block:

- ‘FMT{{TIU Health Summary Object}}FMT
- ‘FMT{Example of non-formatted found text.}FMT

If the text in a not-format block spans multiple lines in the Found/Not Found Text, then it will have the same number of lines in the Clinical Maintenance Output since it is not formatted. An example of where this could happen is if you are using CSUB Objects and each of them has to be on its own line. If you do not want to output text to be on multiple lines, you can force lines to be joined by starting the line you want appended to the previous line with the underscore character.
In the example below:

```
‘FMT {The lab test $$CSUBTEXT(TEST NAME,6) was last done for the patient on: _$$CSUBNUM(DATE,D:5Z,6,)}FMT
```

After $$CSUBTEXT(TEST NAME,6) and $$CSUBNUM(DATE,D:5Z,6,) are replaced with the test name and date for finding 6, the text will be combined into a single line.

When using TIU and CSUB objects, keep in mind that they cannot be broken across two lines. If they are broken across two lines, they will not be recognized as objects.

**CSUB Objects**

CSUB Objects have a function similar to TIU Objects. Like TIU Objects, they can be used in reminder definitions in the following areas:

- Age Match Text/Age No Match Text
- Findings Found Text/Not Found Text
- Function Findings Found Text/Not Found Text
- Patient Cohort Logic:
  - General Cohort Found Text/Not Found Text
  - Summary Cohort Found Text/Not Found Text
- Resolution Logic:
  - General Resolution Found Text/Not Found Text
  - Summary Resolution Found Text/Not Found Text

In the Clinical Maintenance Output, the CSUB Object will be replaced by the text created when the CSUB Object is evaluated.

CSUB Objects and TIU Objects can be used together, but you should always test the output to make sure there are no anomalies. For both CSUB Objects and TIU Objects, the entire object must be on one line. If there is text to be followed by an object and there is not enough room for the entire object on the line, place the object on the next line. When the output text is formatted, the object text will be in the right place.

Originally, CSUB Objects were only going to work for the data elements with the CSUB label you see in the FIEVAL array when doing a reminder test (hence the name), but it was found that they could work for any data in the FIEVAL array. If you want to know what data is available to use with CSUB Objects, run the reminder test for the definition you are working on and examine what is in the FIEVAL array.

There are four types of CSUB data:

- Finding dates
- Internal values
- Numbers
- Text

Accordingly, there are four CSUB Object functions:

- $$CSUBDATE
- $$CSUBINTE
The optional CELLFORMAT argument can be used with all the CSUB Object functions. This argument gives these objects a behavior similar to a cell in a spreadsheet.

CELLFORMAT is a letter followed by a number, followed by a colon, followed by a pad character, which is a character used to fill empty space. The letter can be:
- L-left justify
- R-right justify
- C-Center justify

The number is the number of characters in the cell. If the object text has fewer characters than the number, it is filled with the pad character. If the object text has more characters than the number, it is truncated. In most cases, the pad character will be a space. If it is not defined, it defaults to space.

Examples of CELLFORMAT are listed below:
- ‘L15: ’ – A left justified cell, 15 characters wide, the pad character is space
- ‘R22:+’ – A right justified cell, 22 characters wide, the pad character is plus
- ‘C7: ’ – A center justified cell, 7 characters wide, the pad character is space

If the letter is not L, R, or C, cell formatting is not done.

See Example 1 at the end of the Building Tables section for how the choice of the pad character affects the output.

This cell formatting capability provides the ability to create data tables using CSUB Objects. See Example 1 and Example 2 at the end of the Building Tables section.

A detailed description of each of the CSUB Object functions is listed below. In the descriptions, optional arguments are enclosed in square brackets, i.e., [optional argument].

$\textit{CSUBDATE}$ is used for lists of finding dates. The arguments are:
- $\textit{CSUBDATE}\text{(Function(Finding List),Format,[Text])}$
  where Function can be MRD (most recent date) or MIN_DATE (oldest date).

Finding List is a list of finding numbers. There must be at least one finding number in the list. Format is Date Format[:Cell Format].

Date Format controls how the date is written. The Kernel API: FMTE^XLFDT, which is documented in the Kernel Developer’s Guide, is used to format the date. The allowed values are:
- If null, return the written-out format
- If +Format = 1, then return standard VA FileMan format
- If +Format = 2, then return MM/DD/YY@HH:MM:SS format
- If +Format = 3, then return DD/MM/YY@HH:MM:SS format
- If +Format = 4, then return YY/MM/DD@HH:MM:SS format
- If +Format = 5, then return MM/DD/YYYY@HH:MM:SS format
- If +Format = 6, then return DD/MM/YYYY@HH:MM:SS format
- If +Format = 7, then return YYYY/MM/DD@HH:MM:SS format

Clinical Reminders Manager’s Manual 129 May 2021
• If Format contains a “D”, then date only
• If Format contains an “F”, then output date with leading spaces
• If Format contains an “M”, then only output “HH:MM”
• If Format contains a “P”, then output “HH:MM:SS am/pm”
• If Format contains an “S”, then force seconds in the output
• If Format contains a “Z”, then output date with leading zeroes

Text is optional text, which will be returned if none of the findings in the finding list is true.
Examples are listed below:

```$CSUBDATE(MRD(1,3,5),1D) - The most recent date from findings 1, 3, and 5 in standard VA FileMan format with the date only, no time, and no cell formatting.

$CSUBDATE(MRD(1,3,5),1D,No dates were found) - The most recent date from findings 1, 3, and 5 in standard VA FileMan format with the date only, no time. If findings 1, 3, and 5 are all false, then the text “No dates were found” is returned.

$CSUBDATE(MIN_DATE(4),2Z:L20: ) - The date of finding 4 in the format MM/DD/YY@HH:MM:SS with leading zeroes, in a left justified cell 20 characters wide, the Pad Character is space.
```

$CSUBINTE is used to convert data from internal format to external format. This includes sets of codes and pointers. The arguments are:
$CSUBINTE(Subscription,[Cell Format],File Number,Field Number,Finding Number,[Occurrence],[Separator],[Piece],[Text]) where

- **Subscription** is the data element subscript.
- **[Cell Format]** is described in the middle of the CSUB Objects section.
- **File Number** is the file number where the data element is stored.
- **Field Number** is the field in the file where the data element is stored.
- **Finding Number** is the finding number.
- **[Occurrence]** is the occurrence, used only if the value for an occurrence is desired. The Occurrence Count in the reminder definition should be set equal to or greater than the number of occurrences you are planning to display.
- **[Separator]** Some data elements have multiple pieces of data and this is the character that separates them.
- **[Piece]** works in conjunction with Separator. If there are multiple pieces of data, this specifies which one you want. If Piece is not specified, it defaults to 1. If Separator is not passed, Piece is ignored.
- **[Text]** If the data element does not exist, then Text will be returned.

Examples are listed below:

For a health factor finding, where: FIEVAL(3,"CSUB","LEVEL/SEVERITY")="H"
The corresponding CSUB Object is: $CSUBINTE(LEVEL/SEVERITY,,9000010.23,.04,3)
9000010.23 is the file number for V Health Factors, .04 is the field number for Level/Severity and the finding number is 3.

The same as above, only now we want the second occurrence of finding number 3.
FIEVAL(3,2,"CSUB","LEVEL/SEVERITY")="MO"

The corresponding CSUB Object is: $$CSUBINTE(LEVEL/SEVERITY,,9000010.23,,04,3,2)

For PCE findings, if INCLUDE VISIT DATA is YES, then data from the Visit file entry will be included. One of them is SERVICE CATEGORY, which is a set of codes. An example is: FIEVAL(4,1,"CSUB","SERVICE CATEGORY")="X"

The corresponding CSUB Object is: $$CSUBINTE(SERVICE CATEGORY,,9000010,,07,4,1)
Where 9000010 is the file number for the Visit file and .07 is the field number for Service Category.

The example below shows how to convert a pointer to its external value. A taxonomy finding can find results in V CPT, V POV, V STANDARD CODES and PROBLEM files. In the example below, we know the result came from PROBLEM, file number 9000011. Provider Narrative is field number .05 in the PROBLEM file.

FIEVAL(22,1,"CSUB","PROVIDER NARRATIVE")=1166
FIEVAL(22,1,"FILE NUMBER")=9000011
The corresponding CSUB Object is:
$$CSUBINTE(PROVIDER NARRATIVE,L40: ,9000011,,05,22,1)

$$CSUBNUM is used when the data element is a number. The arguments are:
$$CSUBNUM(Subscript,Format,Finding Number,[OCCURRENCE],[Separator],[Piece],[Text]) where
• Subscript is the data element subscript.
• Format can be one of two forms, depending on whether the number to be formatted is a date or a number.
  o For dates - D:[Cell Format], where date format can be any of the formats used with CSUBDATE. Note: This gives you the ability to use dates other than the main finding date, which is used by CSUBDATE.
  o For numbers - N:[FC]:[DEC]:[Cell Format], where FC is a format code used by the MUMPS $FNUMBER function as listed in the next bullet. DEC is the number of digits after the decimal point. If the number has more digits than specified by this argument, the output is rounded. If the number has fewer digits, the output is zero filled.
• The format code (FC) can be a combination of the following except as noted:
  o + Forces a "+" for positive values.
  o - Suppresses the "-" for negative values.
  o , Inserts commas every third position to the left of the decimal within the number.
  o T Represents the number with a trailing, rather than a leading sign; positive numbers have a trailing space unless the expression includes a plus sign (+).
  o P Represents negative values in parentheses, positive values with a space on either side; combining with any other code except comma (,) causes a run-time error.
• Finding Number is the finding number.
• [Occurrence] is the occurrence, used only if the value for a selected occurrence is desired. The Occurrence Count in the reminder definition should be set equal to or greater than the number of occurrences you are planning to display.
• [Separator] Some data elements have multiple pieces of data and this is the character that separates them.
• [Piece] Works in conjunction with Separator. If there are multiple pieces of data, this specifies which one you want. If Piece is not specified, it defaults to 1. If Separator is not passed, Piece is ignored.
• [Text] If the data element does not exist, then Text will be returned.

Examples are listed below:
The finding is a vital measurement of temperature. For example:
FIEVAL(4,"CSUB","RATE")=102.3

The corresponding CSUB Object is:
$$CSUBNUM(RATE,N::1,4,,,,No temperature measurement was found)
N in the format specifies it is a number, no format code is passed, and one digit after the decimal will be displayed. If no temperature measurement is found, then the text “No temperature measurement was found.” will be displayed.

For a date other than the main finding date, an example is:
FIEVAL(5,3,"CSUB","DATE")=3170630.094942

The corresponding CSUB Object is:
$$CSUBNUM(DATE,D:5Z,5,3,,A third occurrence of the date was not found.)
D in the format says this is a date and 5Z says display the date as MM/DD/YYYY@HH:MM:SS, with leading zeroes. The finding number is 5 and we are going to show the date for the third occurrence. If the third occurrence does not exist, then the text “A third occurrence of the date was not found.” will be displayed.

$$CSUBTEXT is used when the data element is text. The arguments are:
$$CSUBTEXT(Subscript,[Cell Format],Finding Number,[OCCURRENCE],[Separator],[Piece],[Text])
where
• Subscript is the data element subscript.
• [Cell Format] is described in the middle of the CSUB Objects section.
• Finding Number is the finding number.
• [Occurrence] is the occurrence, used only if the value for an occurrence is desired. The Occurrence Count in the reminder definition should be set equal to or greater than the number of occurrences you are planning to display.
• [Separator] Some data elements have multiple pieces of data and this is the character that separates them.
• [Piece] works in conjunction with Separator. If there are multiple pieces of data, this specifies which one you want. If Piece is not specified, it defaults to 1. If Separator is not passed, Piece is ignored.
• [Text] If the data element does not exist, then Text will be returned.

Examples are listed below:
The finding is a lab test. An example is:
FIEVAL(1,1,"CSUB","TEST NAME")=17-HYDROXYCORTICOSTEROIDS
The corresponding CSUB Object is: $$CSUBTEXT(TEST NAME,,1)
Another example is: FIEVAL(3,3,"CSUB","TEST NAME")=ANTI-THYROID ANTIBODIES GROUP
The corresponding CSUB Object is: $$CSUBTEXT(TEST NAME,,3,3)
It displays the test name for the third occurrence of finding number 3.

**Text Argument**

All the CSUB Objects have an optional Text argument that will be returned as the object text if the data element specified by the Subscript argument and optional Occurrence, Separator, and Piece arguments does not exist. The finding may be true but the specified data element you want to display may not have a value. For example, if you want to display the last three blood pressures, but only two were found, the Text for the third occurrence could be something like “A third blood pressure was not found”.

In Finding Found Text, if the data element will not exist unless the finding is true, there is no point in including the Text argument because the Found Text cannot be displayed when the finding is false. That is not necessarily the case for Function Finding Found Text. The function finding can be true while a finding used in the function finding is false. The Text argument could be used to display information that is relevant to the finding being false, such as “No test results were found.”

**Building Tables**

As mentioned earlier, the optional CELLFORMAT argument facilitates building tables. When building a table, you need to determine how wide each column should be. The total width should not exceed 80 characters.

If the occurrence of a CSUB Object does not exist and there is no default text, then it will be set to the number of pad characters in CELLFORMAT. For example, if the CELLFORMAT is “L15:”, then the CSUB Object will be set to 15 spaces. If every CSUB Object in the row ends up being spaces, then you could end up with an unwanted blank line. Enclosing a table, or portions of it, in a Suppress Blank Line (SBL) block will suppress the display of blank lines. An SBL block starts with SBL{ and ends with }SBL. Just like when found/not found text is formatted, lines in an SBL block are concatenated until a “\" is encountered. The “\" marks the end of a line.

**Note:** The line numbers in the examples were added to facilitate the discussion and do not exist in the Found Text.

**Example 1**

1. Pulse Oximetry\n2. Date Value Entered By Hospital Loc Type\n3. $$CSUBNUM(DATE,D:2M:L14:#,1,1)\n4. $$CSUBTEXT(RATE,R7:#,1,1)\n5. $$CSUBTEXT(EXITED BY,L19:#,1,1)\n6. $$CSUBTEXT(HOSPITAL LOCATION,L18:#,1,1)\n7. $$CSUBINTE(LOCATION TYPE,L6:#,44,2,1,1)\n8. SBL($$CSUBNUM(DATE,D:2M:L14:#,1,2)\n9. $$CSUBTEXT(RATE,R7:#,1,2)\n10. $$CSUBTEXT(EXITED BY,L19:#,1,2)\n11. $$CSUBTEXT(HOSPITAL LOCATION,L18:#,1,2)\n12. $$CSUBINTE(LOCATION TYPE,L6:#,44,2,1,2)\n13. $$CSUBNUM(DATE,D:2M:L14:#,1,3)
1.14 $$CSUBTEXT(RATE,R7:#,1,3)
1.15 $$CSUBTEXT(ENTERED BY,L19:#,1,3)
1.16 $$CSUBTEXT(HOSPITAL LOCATION,L18:#,1,3)
1.17 $$CSUBINTE(LOCATION TYPE,L6:#,44,2,1,3)\\
1.18 $$CSUBNUM(DATE,D:2M:L14:#,1,4)
1.19 $$CSUBTEXT(RATE,R7:#,1,4)
1.20 $$CSUBTEXT(ENTERED BY,L19:#,1,4)
1.21 $$CSUBTEXT(HOSPITAL LOCATION,L18:#,1,4)
1.22 $$CSUBINTE(LOCATION TYPE,L6:#,44,2,1,4)\\}SBL

- Line 1.1 is the overall header for the table.
- Line 1.2 consists of the column headers.
- Line 1.3 is the date of the pulse oximetry finding.
- Line 1.4 is the measured value. This field is named RATE in the Vitals package.
- Line 1.5 is the person who entered the measurement.
- Line 1.6 is the hospital location where the measurement was taken.
- Line 1.7 is the hospital location type.
- Lines 1.3-1.7 are combined to make the first row of the table. The \ at the end of 1.7 marks the end of the first row, which is for the first occurrence of the finding. If the finding is true, the first occurrence will always exist. Since this is Found Text, it will not be displayed unless the finding is true. Lines 1.8-1.12 make the next row of the table. It is a repeat of the data elements in row 1, but for occurrence two.
- Lines 1.13-1.17 are the next row for occurrence three.
- Lines 1.18-1.22 are the next row for occurrence four.

Because the table can display data for up to four occurrences, the Occurrence Count for the finding needs to be at least four. Even though four occurrences have been requested, the patient may not have all four of them. Enclosing the code that creates rows 2 through 4 of the table in an Suppressed Blank Lines (SBL) block will prevent blank lines being added to the table. The SBL block starts on line 1.8 and ends on line 1.22.

This example uses “#” as the pad character to provide a visual representation of how padding works. In most cases, you would not want to see pad characters in a table and your pad character would be a space.

**Example 2**
2.1 $$CSUBNUM(DATE,D:2M:L14: ,1,1) $$CSUBTEXT(RATE,R7: ,1,1)
2.2 $$CSUBTEXT(ENTERED BY,L19: ,1,1) $$CSUBTEXT(HOSPITAL LOCATION,L18: ,1,1)
2.3 $$CSUBINTE(LOCATION TYPE,L6: ,44,2,1,1)\\
2.4 SBL{$$CSUBNUM(DATE,D:2M:L14: ,1,2) $$CSUBTEXT(RATE,R7: ,1,2)
2.5 $$CSUBTEXT(ENTERED BY,L19: ,1,2) $$CSUBTEXT(HOSPITAL LOCATION,L18: ,1,2)
2.6 $$CSUBINTE(LOCATION TYPE,L6: ,44,2,1,2)\\
2.7 $$CSUBNUM(DATE,D:2M:L14: ,1,3) $$CSUBTEXT(RATE,R7: ,1,3)
2.8 $$CSUBTEXT(ENTERED BY,L19: ,1,3) $$CSUBTEXT(HOSPITAL LOCATION,L18: ,1,3)
2.9 $$CSUBINTE(LOCATION TYPE,L6: ,44,2,1,3)\\
2.10 $$CSUBNUM(DATE,D:2M:L14: ,1,4) $$CSUBTEXT(RATE,R7: ,1,4)
2.11 $$CSUBTEXT(ENTERED BY,L19: ,1,4) $$CSUBTEXT(HOSPITAL LOCATION,L18: ,1,4)
2.12 $$CSUBINTE(LOCATION TYPE,L6: ,44,2,1,4)\\}SBL
Example 2 is a repeat of data rows 1-4 in Example 1, with two differences: the pad character is a space and some of the lines in Example 1 have been combined into a single line, so the number of lines for data rows 1-4 has gone from 20 to 12. Some lines contain two CSUB Objects, but no CSUB Object spans two lines.

A CSUB Object will not be recognized if it is broken across two lines. Each CSUB Object in a row must be separated by a space, even if there is only one object per line. In Example 1, you cannot see the space, but it is there. In Example 2, where there are two objects on a line, you can see the space.

The following shows what these two examples look like in the Clinical Maintenance output for a patient who has three pulse oximetry occurrences:

<table>
<thead>
<tr>
<th>Pulse Oximetry</th>
<th>Value Entered By</th>
<th>Hospital Loc</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>6/21/13@12:00</td>
<td>LLLLLLLLL,FFFFFH</td>
<td>3 NORTH SURG</td>
<td>WARD</td>
</tr>
<tr>
<td>5/29/13@11:52</td>
<td>Refused LLLL,FFF</td>
<td>3 NORTH SURG</td>
<td>WARD</td>
</tr>
<tr>
<td>5/29/13@11:18</td>
<td>LLLLLppo,FFFFMMM</td>
<td>3 NORTH SURG</td>
<td>WARD</td>
</tr>
</tbody>
</table>

In Example 1, the pad character is “#”, so you can see it. In Example 2, it is space, so it is not visible but it still affects the column widths. The CELLFORMATs for the columns are described below:

- Date - The CELLFORMAT is L14, but the date format of 2M produces 13 characters, so one pad character has been appended.
- Value - The CELLFORMAT is R7. When the value is two digits, 5 pad characters are prepended. “Refused” is exactly 7 characters, so no pad characters are needed.
- Entered By - The CELLFORMAT is L19. In rows 2 and 3 the last, first and middle name is longer than 19 characters, it is truncated, and no padding is needed.
- Hospital Loc - The CELLFORMAT is L18 and 6 pad characters are required.
- Type - The CELLFORMAT is L6 and 2 pad characters are required.

As noted earlier, this patient has three occurrences so there is no data to display in row 4. Consequently, in row 4 of Example 1, all the columns are filled with the pad character. Since the pad character is “#”, the row is not blank, and it is displayed even though it is in SBL block. In Example 2, the pad character is space, row 4 is blank and because it is in an SBL block, it is not displayed.

Function Findings

Function Findings (FF) do computations on the results from regular findings. Function Findings can be used just like regular findings with one exception, there is no date associated with an FF which means the Resolution Logic cannot be written so that it is made true solely by FFs. Besides providing new and expanded functionality, FFs can make custom logic much simpler to understand.

Function Findings expand upon, and are intended to replace, the old-style "Most Recent Date" (MRD) functionality of Reminders 1.5 that could be used in customized Patient Cohort Logic to return the most recent date from a list of finding items. Old MRD logic released in National Reminders will be converted to Function Findings and the reminders will be redeployed with V.2.0.
Note that this new functionality may be difficult to comprehend. Be advised that you should not attempt to modify existing Function Findings or create new Function Findings unless you understand what they do and test the results thoroughly.

**Patch 26 changes to Function Findings**

The executable help for the function string was upgraded by improving the text and using the Browser to display it.

Users reported that the display of function finding true/false values in the Clinical Maintenance output is useful to CACs, but confusing for clinical users. As a result, a change was made so that the function finding true/false values will be displayed only in the Clinical Maintenance output in reminder test.

Remedy ticket #823815 reported an undefined error during function finding evaluation. The function string being evaluated was “UROLOGY PCU”[“URO”. The error was occurring because a unary operator in the function string is flagged as being unary by appending the operator with a ‘U’. The code checking for unary operator was improperly interpreting the ‘U’ in UROLOGY as a flag for a unary operator which caused the undefined error. The code was corrected. Additional changes: A check was added for division; if none is found, then the logic string is evaluated using indirection; if division is found, then special logic evaluation is used to trap division by zero. This may give a slight improvement in execution speed. The function finding step-by-step output in reminder test was made a little more readable.

Output of function finding true or false values for function findings used in cohort or resolution logic was added in PXRM*2.0*24. The reminder definition VA-IRAQ & AFGHAN POST-DEPLOY SCREEN has a lot of found and not found text and the display of the function finding values in the Clinical Maintenance output was giving the display of the text a poor appearance. This is an example of how it looks without the function finding values:

**Resolution:**
1. PTSD Screening completed since service discharge
2. Depression Screening completed since service discharge
3. Alcohol Screening completed since service discharge

Screening for at risk alcohol use using the AUDIT-C screening tool should be performed yearly for any patient who has consumed alcohol in the past year. No record of prior screening for alcohol use was found in this patient’s record.

4A. Screen for GI symptoms done or not required.
4A. Screen for GI symptoms done or not required.
Screen for diarrhea or other GI complaints that might suggest giardia, amoebiasis or other GI infection.

4B. Screen for Fevers done or not required.
Screen for unexplained fevers that might represent occult malaria or infection with leishmaniasis.

4C. Screen for Skin Rash done or not required.
Screen for persistent rash that might represent infection with leishmaniasis.

This is how it looks with the function finding values displayed:

**Resolution:**

FF(16)=0
FF(2)=1
1. PTSD Screening completed since service discharge
FF(3)=1
2. Depression Screening completed since service discharge
FF(18)=0
FF(4)=1
3. Alcohol Screening completed since service discharge
Screening for at risk alcohol use using the AUDIT-C screening tool should be performed yearly for any patient who has consumed alcohol in the past year. No record of prior screening for alcohol use was found in this patient’s record.
FF(17)=0
FF(5)=1
4A. Screen for GI symptoms done or not required.
FF(5)=1
4A. Screen for GI symptoms done or not required.
Screen for diarrhea or other GI complaints that might suggest giardia, amoebiasis or other GI infection.
FF(6)=1
4B. Screen for Fevers done or not required.
Screen for unexplained fevers that might represent occult malaria or infection with leishmaniasis.
FF(7)=1
4C. Screen for Skin Rash done or not required.
Screen for persistent rash that might represent infection with leishmaniasis.
FF(10)=0

The output as of patch 26 looks like this:

Resolution:
1. PTSD Screening completed since service discharge
2. Depression Screening completed since service discharge
3. Alcohol Screening completed since service discharge
Screening for at risk alcohol use using the AUDIT-C screening tool should be performed yearly for any patient who has consumed alcohol in the past year. No record of prior screening for alcohol use was found in this patient’s record.

4A. Screen for GI symptoms done or not required.
4A. Screen for GI symptoms done or not required.
Screen for diarrhea or other GI complaints that might suggest giardia, amoebiasis or other GI infection.

4B. Screen for Fevers done or not required.
Screen for unexplained fevers that might represent occult malaria or infection with leishmaniasis.

4C. Screen for Skin Rash done or not required.
Screen for persistent rash that might represent infection with leishmaniasis.

FF(2)=1, FF(3)=1, FF(4)=1, FF(5)=1, FF(6)=1, FF(7)=1, FF(10)=0, FF(16)=0, FF(17)=0, FF(18)=0
**Patch 24 Changes to Function Findings**

Remedy ticket #742674 showed the undefined error `<UNDEFINED>MRD+2¬PXRMFF0 *FIEVAL("1")` when trying to evaluate a function finding using the MRD function for a taxonomy finding. This was occurring because during the evaluation, a lock could not be obtained for the taxonomy expansion and the finding was not being set to false as it should have been. This was corrected.

Function findings were changed in PXRM*2*18 to allow the MUMPS division operators in the function string, which meant there is the possibility of division by 0. The function finding evaluation code was changed, to trap a division by 0 so it would not generate an error, and the function finding was set to false if there was a division by 0. During testing of PXRM*2*24, it was determined that this behavior was not optimal since only the portion of the function string involving the division by 0 should be set to false. The function finding evaluator was changed to do this and a new feature was added to reminder test that shows step-by-step how the function string is evaluated. Also the display of the reminder test was moved to the FileMan Browser to make it easier to view.

A fix was made for a problem reported in Remedy ticket #242214, which reported that reminder tests produced an error when either a patient or a reminder was not selected.

**Patch 18 Changes to Function Findings**

The set of allowed operators in function finding strings was expanded. It now includes: +, -, *, **, /, \, #, !, &, ` >, <, =, ]]. The additions were *, **, /, \, #.

All function findings were improved to handle the case when the findings they use are false. Functions will now return the value “UNDEF” when they cannot be evaluated.

An optional third argument of “NAV” was added to the DIFF_DATE function. If this argument is present, the actual value instead of the absolute value is returned.

Two new functions, MAX_VALUE and MIN_VALUE, were added.
A new function DIFF_DT which is a generalized version of DIFF_DATE was added.

There were some CSUBs that could not be used in a function finding because they would not pass the input transform. ”ADMISSION DATE/TIME” is an example of one that could not be used. It was not passing because of the space and the “/”. The input transform was changed to allow all legitimate CSUBs.

Clin2 reported that a list type reminder that used the VALUE function in a function finding failed the validation when creating a reminder rule. This was because the validator was written before functions could have CSUB values as arguments. The validation code was changed to handle those cases.

**Creating a Function Finding**

To define or edit a Function Finding, select the option “FF Function Finding” from the reminder definition editor (in Add/Edit Reminder Definition or Copy Reminder Definition on the Reminder Definition Management menu).
The name of a Function Finding is a number, so, when prompted to “Select FUNCTION FINDING,” enter a number. Function Finding number 1 is created in the following example:

```
Select Reminder Definition: FFTEST LOCAL
Select one of the following:
A  All reminder details
G  General
B  Baseline Frequency
F  Findings
FF  Function Findings
L  Logic
C  Custom date due
D  Reminder Dialog
W  Web Addresses
Select section to edit: FF Function Findings
Function Findings
Select FUNCTION FINDING: 1
Are you adding '1' as a new FUNCTION FINDINGS (the 1ST for this REMINDER DEFINITION)? No// Y
(Yes)
FUNCTION FINDINGS FUNCTION STRING: MRD(1,3)>MRD(11,8,4)
FUNCTION FINDING NUMBER: 1// <Enter>
FUNCTION STRING: MRD(1,3)>MRD(11,8,4) Replace <Enter>
FOUND TEXT:
No existing text
Edit? NO// <Enter>
NOT FOUND TEXT:
No existing text
Edit? NO// <Enter>
USE IN RESOLUTION LOGIC: <Enter>
USE IN PATIENT COHORT LOGIC: <Enter>
REMINDER FREQUENCY: <Enter>
MINIMUM AGE: <Enter>
MAXIMUM AGE: <Enter>
RANK FREQUENCY: <Enter>
Select FUNCTION FINDING: <Enter>
```

When prompted, enter the number of the finding you want to create/edit. If the function finding number does not exist, you will be asked to confirm that you want to add a new function finding:

```
Select FUNCTION FINDING: 1
Are you adding '1' as a new FUNCTION FINDINGS (the 1ST for this REMINDER DEFINITION)? No// Y
(Yes)
```

Next, you will be prompted to add the Function Finding string.

```
FUNCTION FINDINGS FUNCTION STRING: MRD(1,3)>MRD(11,8,4)
```

Then the name and the FUNCTION STRING will be displayed on the screen so you can modify the FUNCTION STRING if you wish to do so:

```
FUNCTION FINDING NUMBER: 1//
FUNCTION STRING: MRD(1,3)>MRD(11,8,4) Replace
```

Lastly, you will be prompted for the following fields, which work the same as they do with regular Findings.

```
FOUND TEXT:
No existing text
Edit? NO//
NOT FOUND TEXT:
No existing text
```
If the FF is true and USE IN RESOLUTION LOGIC and USE IN PATIENT COHORT LOGIC are not specified, the FF found/not found text will appear under the Clinical Maintenance Information heading.
Function Findings Primer

Function findings operate on data from standard findings and return computed data. They can be used in patient cohort logic and resolution logic or for display as informational text. Function findings functions are stored in file #802.4, this file defines the functions that can be used in function finding strings.

- OPERATORS and GLOBAL VARIABLES
- MRD
- MAX_DATE
- MIN_DATE
- COUNT
- FI
- DUR
- DIFF_DATE
- DTIME_DIFF
- VALUE
- NUMERIC
- MAX_VAL
- MIN_VAL

Operators and Global Variables

The mathematical operators that can be used are as follows:

+ ADD
- Subtract
* Multiply
/ Divide by
\ Integer division (remainder is dropped)
** Exponential
# Modulus (remainder)
> Greater than
< Less than
=

The logical operators that can be used are as follows:

& And
! Or
\ Not
[ Contains
] Follows

Please note that even though all of these operators may be used within function findings, it is not always clinically relevant to use them. We will list the operators for each function that would clinically apply.

For example, we could multiply the date of FI(1) by the date of FI(2) and do a comparison to some number, but that would not be clinically relevant.

Function string: MRD(1)*MRD(2)>60
Clinically, there would be no reason to multiply two dates.

Certain **Global Variables** are set every time a reminder is evaluated on a patient. These are as follows:
- **PXRMAGE** – Returns the patient’s age
- **PXRMDOB** – Returns the patients date of birth in FileMan format
- **PXRMDOB** – Returns the patients date of death, if it exists, in FileMan format
- **PXRMSEX** – Returns the patient’s sex

Global variables may be used in function findings as part of the string.
Example:  MRD(1)>MRD(2)&(PXRMAGE>50)
The Global Variables may NOT be the only part of the string.

**MRD**
This function returns the most recent date of the finding(s) in the argument list of the MRD string, and then makes a comparison based on the operator used to another MRD string or a reminder global variable.
All mathematical operators may be used with MRD, but the relevant operators include:
- Greater than - >
- Less than - <
- Equals - =

Relevant logical operators include:
- Not – ‘
- And - &
- Or - !

These may be used in combinations as well; i.e. ‘<, ‘=, ‘>

Examples:
1.  MRD(1)>MRD(2)  This would be true if the date of finding 1 is less than or equal to the date of finding 2.  This is because of the “NOT GREATER THAN” notation which implies “less than or equal to.”
2.  MRD(1,2)<MRD(3)  This would be true if the most recent date of finding 1 and 2 is less than the date of finding 3.  If both finding 1 and 2 are true, the function would return the most recent date of those two for the comparison to finding 3.
3.  MRD(1,2)=MRD(3,4)  This would be true if the most recent date of finding 1 and 2 is equal to the most recent date of finding 3 and 4.  If both finding 1 and 2 are true, the function would return the most recent date of those two.  The same would hold true for the second part of this string, where, for comparison, the most recent date of finding 3 or 4 would be returned.
4.  MRD(1)>PXRMSEX  This would be true if the date of finding 1 is more recent than the patient’s last admission date.
5.  (MRD(1,2) >MRD(4))&(PXRMDOB>2500101)  This would be true if the most recent date of findings 1 and 2 is more recent than the date of finding 4, AND the patient’s date of birth is after January 1, 1950.

Be aware that if you have a date range defined by Beginning Date/Time (BDT) and Ending Date/Time (EDT) set on the finding(s) that is part of the MRD string, it could affect the date returned. For example, your string is MRD(1,2)>MRD(3) and there is no EDT entry on either finding, then the function will work as described above. If there is an EDT entry, let’s see how the outcome is affected.

FI(1) has ending date/time entry of T-1Y and FI(2) has NO EDT:
Dates of findings, and assuming today is 7/29/10 for the example:

<table>
<thead>
<tr>
<th>FI(1)</th>
<th>FI(2)</th>
</tr>
</thead>
<tbody>
<tr>
<td>7/24/10</td>
<td>6/18/10</td>
</tr>
<tr>
<td>2/3/10</td>
<td>4/8/10</td>
</tr>
<tr>
<td>6/1/09</td>
<td>3/20/08</td>
</tr>
</tbody>
</table>

Given these dates with the EDT entry on FI(1), the MRD that would be used to compare to FI(3) would be date of 6/18/10 from FI(2). Even though the FI(1) dates of 7/24/10 and 2/3/10 exist, because of the ending date/time entry of T-1Y, they are not considered in the evaluation.

Another caveat of the MRD functionality is the use of a finding in the MRD string that has a negative occurrence count.

Example:  MRD(1)>MRD(2) and Finding 1 has a -1 occurrence count

<table>
<thead>
<tr>
<th>FI(1)</th>
<th>FI(2)</th>
</tr>
</thead>
<tbody>
<tr>
<td>7/24/10</td>
<td>8/18/10</td>
</tr>
<tr>
<td>2/3/10</td>
<td>4/8/10</td>
</tr>
<tr>
<td>6/1/09</td>
<td>3/20/08</td>
</tr>
</tbody>
</table>

With FI(1) having a -1 as occurrence count, the function string MRD(1)>MRD(2) would evaluate to false because the date of FI(1) would be 6/1/09, which is the OLDEST occurrence retrieved by use of the -1 in the occurrence count of FI(1).

MRD can be also combined with other functions and global variables as below:

MRD(1)>MIN_DATE(2)&(COUNT(2)>3)
MRD(2)>3100510!(PXRMAGE>45)

CLASS: NATIONAL

MAX_DATE

MAX_DATE is just another name for MRD so everything in the above discussion of MRD applies to MAX_DATE.

CLASS: NATIONAL

MIN_DATE

This function finding returns the oldest date of the finding(s) in the argument list of the MIN_DATE string, and then makes a comparison based on the operator used to another MIN_DATE string or a global variable.

All mathematical operators may be used with MIN_DATE but the relevant operators include:

Greater than - >
Less than - <
Equals - =
Relevant logical operators include:
   Not – ‘
   And - &
   Or - !
These may be used in combinations as well, i.e. ‘<, ‘=, ‘>

Examples:
   1. MIN_DATE(1)>MIN_DATE(2)  This would be true if the date of finding 1 is more recent than the date of finding 2
   2. MIN_DATE(1,2)<MIN_DATE(3)  This would be true if the oldest date of finding 1 and 2 is less than the date of 3. If both finding 1 and 2 are true, the function would use the oldest date of those two for the comparison to finding 3
   3. MIN_DATE(1,2)=MIN_DATE(3,4)  This would be true if the oldest date of finding 1 and 2 is equal to the oldest date of finding 3 and 4. If both finding 1 and 2 are true, the function would use the oldest date of those two. The same would hold true for the second part of this string where for comparison, the oldest date of finding 3 or 4 would be used.
   4. MIN_DATE(1)>PXRMLAD  This would be true if the date of finding 1 is more recent than the patient’s last admission date.
   5. (MIN_DATE(1,2)>MIN_DATE(4))&(PXRMDOB>2500101)  This would be true if the oldest date of findings 1 and 2 is more recent than the date of finding 4 AND the patient’s date of birth is after January 1, 1950.

Please note that if you have date range defined by Beginning Date/Time (BDT) and Ending Date/Time (EDT) on a finding it may impact your results. The date range will restrict the dates used for evaluation to only those occurring during the specified date range. So your oldest finding date will be the oldest one of those within the range.

For example, in the Function Finding of MIN_DATE(1) > MIN_DATE(2), below is a list of all the dates for each finding.

<table>
<thead>
<tr>
<th>FI(1)</th>
<th>FI(2)</th>
</tr>
</thead>
<tbody>
<tr>
<td>7/29/10</td>
<td>6/26/10</td>
</tr>
<tr>
<td>6/15/10</td>
<td>4/1/09</td>
</tr>
<tr>
<td>3/26/08</td>
<td>2/5/08</td>
</tr>
</tbody>
</table>

With no BDT defined on either finding the evaluation of MIN_DATE(1) > MIN_DATE(2) would be 7/29/10>6/26/0, thus the finding is TRUE.
If you had a BDT of T-1Y on FI(1) (given today is 7/29/10) the evaluation of MIN_DATE(1) > MIN_DATE(2) would now be 6/15/10>6/26/10, thus the FF is FALSE.

Another caveat of the MIN_DATE functionality is the use of a finding in the MIN_DATE string that has a negative occurrence count.
Example:  MIN_DATE(1)>MIN_DATE(2)  and Finding 1 has a -2 occurrence count

<table>
<thead>
<tr>
<th>FI(1)</th>
<th>FI(2)</th>
</tr>
</thead>
<tbody>
<tr>
<td>7/24/10</td>
<td>6/18/10</td>
</tr>
<tr>
<td>2/3/10</td>
<td>4/8/10</td>
</tr>
<tr>
<td>6/1/09</td>
<td>3/20/08</td>
</tr>
</tbody>
</table>
With FI(1) having a -2 as occurrence count, the function string MIN_DATE(1)<MIN_DATE(2) would evaluate to true because MIN_DATE of FI(1) would be 6/1/09 and MIN_DATE of FI(2) would be 6/18/10.

MIN_DATE can be also combined with other functions and global variables as below:

\[ \text{MIN_DATE(1)}>\text{MIN_DATE(2)}&(\text{COUNT(2)}>3) \]
\[ \text{MIN_DATE(2)}>3100510!(\text{PXRMAGE}>45) \]

CLASS: NATIONAL

COUNT

The COUNT Function Finding checks to see if there are a certain number of true occurrences of a particular finding. The syntax of this function finding is \( \text{COUNT(N)}>3 \). In this example, a check is done to see if there are more than 3 occurrences of FI(N). The COUNT function works in conjunction with the occurrence count parameter of the finding number that COUNT is looking at. If you have your COUNT string set as \( \text{COUNT(1)}>2 \), then on FI(1), you will need to ensure the occurrence count is set to at least 3. There are other factors that come into play as well, such as entries on the following fields: CONDITION, BEGINNING DATE/TIME, ENDING DATE/TIME, USE STATUS/COND IN SEARCH. These will be addressed below.

All mathematical operators that may be used with COUNT, but the relevant operators or operator combinations include:

- Less than - <
- Greater than - >
- Equal to - =
- NOT – ‘
- AND - &
- OR - !

With no entries on the above mentioned fields (CONDITION, BEGINNING DATE/TIME, ENDING DATE/TIME, USE STATUS/COND IN SEARCH), the COUNT works as follows:

FI(N) has occurrence count of 3
FF(N) has string of \( \text{COUNT(N)}>2 \)
The FF(N) will be true if FI(N) has at least 3 occurrences

If FI(N) has dates defined on beginning date/time or ending date/time, then when COUNT is invoked, it will look for the number of occurrences designated by the entry in the occurrence count field within those date ranges and then based on what the string of COUNT is, will make a determination of TRUE or FALSE.

With Use Status/Condition in Search set to NO

If FI(N) has a Condition or Status associated, then the number of returned occurrences will be less than or equal to the occurrence count. Each returned occurrence will have the condition applied so they may be true or false. Also, if there are entries on beginning date/time and ending date/time, those parameters will also be considered in the evaluation of the FF. Example: FI(1) is an A1C lab test with condition of IV>9.0 and occurrence count of 5. Given a list of values within the date range specified by beginning date/time and ending date/time are as follows:
The value of COUNT(1) will be 2 because only the last five occurrences are considered. If you had a string of COUNT(1)>2, then the FF would be false.

**With Use Status/Condition in Search set to YES**

Again, assuming occurrence count of 5 on FI(N) (Lab test) and condition of IV>9.0, up to the last 5 occurrences that actually meet the condition within the date range will be returned. Given the same list of values as above, the number of occurrences up to the occurrence count that meet the condition will be returned.

The bold values will be returned and if the String of the FF was COUNT(N)=5, then the FF would be TRUE. Be careful with the use of USE STATUS/CONDITION in SEARCH as it will affect your outcome.

COUNT can be also combined with other functions and global variables as below:

- COUNT(1)>2&(COUNT(3)=1)
- COUNT(4)=2!(MRD(2)>MRD(1))
- COUNT(3)<5&(PXRMAGE>50!PXRLAD>3100317)

**FI**

This function provides a way to logically string regular findings and/or other functions and/or reminder global variable combinations together. The function will be evaluated and return a TRUE or FALSE value. Complex strings can be written using parenthesis to group items together.

Below are some examples. In some of these examples you will see the use of the global variables and other functions:

- FI(1)&FI(2)&(FI(3)!FI(4))
- F(1)&FF(1)&'FF(2)
- FI(2)&FF(1)&(MRD(1)>PXRLAD)
- FI(2)&FI(3)&FI(4)&'FF(1)&(PXRMSEX="F")&(PXRMDOB>2500101)

**DUR (Duration)**

For findings that have a start and stop date (orderable items, medications), DUR will be the number of days between the start and stop date of the finding. For orders/medications that do not have a stop date, the current date is used as the stop date.

- DUR(N)>60

**Orderable Item example**

- FI(1)=OI.HEMATOLOGY CONSULT
- FF(1)=DUR(1)>60

Here is an excerpt from a reminder test to show how this works for a finding with no stop date:

**Orderable Item: HEMATOLOGY CONSULT**

- 06/20/2006 Status: pending, Start date: 04/02/2004, Stop date: missing

The DUR would be 809 days:
FIEVAL("FF1","VALUE")=809 if the current date was 6/20/2006. The reminder calculates the number of days from 04/02/2004 (start date of consult) and stop date, which in this case we are using 06/20/2006 as the current date.

For findings that have only a single date, DUR works in conjunction with the Occurrence Count Field and is the number of days between the first and last occurrence. If there is only one occurrence, then DUR will be 0. The default value of the occurrence count field is 1, therefore, if you are using the DUR on a finding that only has 1 as the occurrence count, the DUR will always be 0. Your Occurrence Count Field setting will determine which findings are evaluated. For example, let’s assume you have a specific Health Factor (HF) that is in a Veterans record 10 times. If your Occurrence Count is set to 5, the DUR will be only evaluated between the most recent date of the HF and that of the 5th most recent date of the HF. If your Occurrence Count is set to 99, then the most recent and the oldest dates of the HF are compared to give the DUR. Since the highest numerical value for the occurrence count field is 99, in theory, if you had 200 occurrences (of a blood pressure or pain score), then instead of getting the duration of the most recent occurrence and the 200th occurrence, you would in actuality get the duration of the most recent and the 99th occurrence.

Please note that if you have a Beginning Date Time (BDT) or Ending Date Time (EDT) on your finding, the Occurrence Count will only pull the specified number of entries during that time frame and then do the DUR evaluation on the First and Last dates of those "filtered" list of finding items.

Another example showing how your return value for DUR could be affected by occurrence count entry: Finding 1 is a Health Factor with given entry dates:
- 3100624 (June 24, 2010)
- 3090516 (May 16, 2009)
- 3080516 (May 16, 2008)

If the function finding string is DUR(1)>370 and if the occurrence count of FI(1) is set to a value of 2, then DUR would be true because difference would be 404, which is the difference between the most recent and second most recent entries. If occurrence count is set to -2, then DUR would be False because difference is 365, which is the difference between the oldest and second oldest entries.

DUR can be also combined with other functions and global variables as below:
- DUR(1)>120&(DIFF_DATE(1,2)>100)
- DUR(2)<50&((PXRMAGE>75)&(MRD(1)>3060910))

CLASS: NATIONAL

DIFF_DATE
This function returns the difference in days between the dates of the two findings listed as parameters. The default is to return the absolute value, but if the optional third parameter of “N” is present, the actual value is returned. If you want the actual value, be aware that if the date of the second parameter is more recent than the date of the first parameter, the result will be negative.

Syntax: DIFF_DATE(M,N)>n where the “M” and “N” are findings and are also called parameters in this case and n is the number of days.

Some examples:
Given dates
- FI(1)=3100710 (July 10, 2010)
- FI(2)=3100720 (July 20, 2010)
DIFF_DATE(1,2)>5 This will evaluate as TRUE because there are 10 days (absolute value) between FI(1) and FI(2).

DIFF_DATE(1,2,"N")<-6 This will evaluate as TRUE because there are negative 10 (-10) days between FI(1) and FI(2). If we simply change the order of the parameters (FI(1) and FI(2)), it will change the evaluation as long as the “N” is left as a third parameter.

DIFF_DATE(2,1,"N")<-6 This will evaluate as FALSE because there are 10 days between FI(1) and FI(2).

You cannot use reminder global variables directly in the DIFF_DATE function since it only works on dates of regular findings. You can use the Computed Finding VA-FILEMAN DATE to create a regular finding with a specific date. For example, if you want to determine if the date of finding 1 occurred more than 20 days after the last admission, set up the computed finding (VA-FILEMAN DATE) with PXRMLAD in the Computed Finding Parameter field. If finding 2 is the computed finding, the function string would be DIFF_DATE(1,2)>20. Another example would be to compare the date of FI(1) to today’s date. Again, you would use the computed finding VA-FILEMAN DATE and enter TODAY or NOW (if you want the time included) into the computed finding parameter field. Then function string would be something like DIFF_DATE(1,2)>200.

In the above examples, the assumption is made that there are no entries on beginning date/time and ending date/time fields. Again, as with other functions, having a date range on the finding could affect the dates that are used. Let’s give an example.

FI(1) dates:
- 3100501
- 3090501

FI(2) dates:
- 3100525

FI(1) has an ENDING DATE/TIME entry of 3100430. FI(2) has no ENDING DATE/TIME entry. Given these dates and a DIFF_DATE string of DIFF_DATE(1,2)>30, the FF will be TRUE because for FI(1), the date that will be used is 3090501 due to the entry in ENDING DATE/TIME field. The comparison would be 389>30 which is true. The 389 value is the number of days between FI(1) and FI(2). If you remove the ENDING DATE/TIME entry, then the FF will be FALSE because for FI(1), the date that will be used is 3100501. The comparison would be 24>30 which is false. The 24 value is the number of days between FI(1) and FI(2).

DIFF_DATE can be also combined with other functions and global variables as below:
- DIFF_DATE(1,2)>100&(MRD(1,2)>MRD(3))
- DIFF_DATE(2,4)=0!(PXRMDOB>2450101)

CLASS: NATIONAL

DTIME_DIFF
This function is a generalized function that returns the difference in time between the dates of two findings. The difference in time can be displayed down to the second. It can be displayed by Days, Hours, Minutes or Seconds. This function also gives you the ability to look at specific occurrences and CSUB items. Note that if you want to compare an occurrence other than the first, you must set the occurrence count on that finding to be greater than 1. Also, fields such as BEGINNING DATE/TIME, ENDING DATE/TIME, CONDITION, USE STATUS/COND IN SEARCH can change the dates returned by the function.
Syntax:  `DTIME_DIFF(F1,O1,C1,F2,O2,C2,U,"A")` where F is finding number, O is occurrence number, C is CSUB item, U is units which can be D for Days, H for Hours, M for Minutes or S for Seconds. If A is present, then the absolute value of the difference will be returned. If A is omitted, then the result could be calculated as a negative value.

Any of the parameters in the `DIFF_DT` function that are text must be in quotes.

Example:  `DTIME_DIFF(1,1,"DATE",2,1,"DATE","D","A")`

In this example the absolute value, in Days, the difference between finding 1, occurrence 1 DATE CSUB and finding 2, occurrence 1 DATE CSUB

Some examples of `DTIME_DIFF`

- FI(1) has 3 occurrences and we have the occurrence count set to 3
- Dates of occurrences:
  - 3100409
  - 3090409
  - 3080409

`DTIME_DIFF(1,1,"DATE",1,2,"DATE","D","A")>300` would evaluate to TRUE because the absolute difference in DAYS between the first occurrence of finding 1 date and the second occurrence of finding 1 date is 365 days, so 365>300.

`DTIME_DIFF(1,1,"DATE",1,3,"DATE","H")>14400` would evaluate to TRUE because the difference in HOURS between the first occurrence of finding 1 date and the third occurrence of finding 1 date is 17520 hours, so 17520>14400

`DTIME_DIFF(1,2,"DATE",1,1,"DATE","D")>50` would evaluate to FALSE because the difference in DAYS between the second occurrence of finding 1 date and the first occurrence of finding 1 date is -365 days, so -365>50 is FALSE. The reason the result is negative (-365) is because we did not specify the “A” parameter for absolute value.

`DTIME_DIFF` can be also combined with other functions and global variables as below:

- `DTIME_DIFF(1,1,"DATE",1,2,"DATE","D")>60&(COUNT(2)=5)`
- `DTIME_DIFF(1,1,"DATE",2,1,"DATE","D","A")<400&(PXRMAGE>40)`

CLASS: NATIONAL

VALUE

The VALUE function returns any of the “CSUB” values of a particular occurrence of a finding for comparison to a different occurrence of the same finding or to an occurrence of a different finding. The argument list is the finding number, the occurrence and the CSUB of interest. For example, if you wanted to check to see if occurrence 1 of finding 4 was less than occurrence 2 of the same finding, the function string would be `VALUE(4,1,"VALUE")<VALUE(4,2,"VALUE")`. If you are comparing multiple occurrences of a particular finding, then you must remember to set the occurrence count on that finding to a value high enough to work in your function string. Note that fields BEGINNING DATE/TIME, ENDING DATE/TIME, CONDITION, USE STATUS/COND IN SEARCH may have significant impact on the data returned by the VALUE function. Also, using a negative number in the occurrence count will/could have a significant impact on the results returned.

Common operators used with the VALUE function are:

- Greater than - >
- Less than - >
- Equals - =
- AND - &
- OR - !
- NOT - '
Examples:
I. FI(1) is a lab test with occurrence count set to 3. Values are as follows
   6.0
   5.5
   5.0

   VALUE(1,1,"VALUE")>(VALUE(1,2,"VALUE"))>(VALUE(1,3,"VALUE"))

   6.0>5.5>5.0 would evaluate to TRUE which could be clinically significant because the value is trending upwards.

II. FI(1) is an education topic with occurrence count set to 2. The CSUB “Level of Understanding” values are as follows:
   Occurrence 1 – POOR
   Occurrence 2 – POOR

   VALUE(1,1,"LEVEL OF UNDERSTANDING")="POOR"&(VALUE(1,2,"LEVEL OF UNDERSTANDING")="POOR")
   This could be clinically significant because the last two education topics level of understanding was POOR

   VALUE can be also combined with other function and global variables as below:
   VALUE(1,1,"LEVEL OF UNDERSTANDING")="POOR"&(COUNT(2)=2)
   VALUE(1,1,"LEVEL OF UNDERSTANDING")="POOR"!(PXRMLAD>3100909)

   CLASS: NATIONAL

NUMERIC
The NUMERIC function returns the first numeric portion of any CSUB value for a particular finding. For example, if the COMMENT field of a health factor contains a numeric value (i.e. an outside lab result), NUMERIC can be used test it.

Assume FI(1) is a Health Factor for an outside HGB A1C result. On the reminder dialog, there is a comment field associated with the dialog element. If a numeric value is entered into the comment field as a piece of the comment, then this becomes computable data for the NUMERIC function. This value in this comment field is stored in PCE associated with the health factor, so that when a reminder is evaluated, that value can be used as a possibility for cohort or resolution logic or displayed as informational text.

The syntax of NUMERIC is finding number, occurrence, CSUB.
NUMERIC(1,1,"COMMENT")>5.0  This essentially says the function will be true if the very first numeric portion of the comment field of finding 1, occurrence 1 is greater than 5.0. Please note that if the comment field entry is “A1C: 8.5”, then the part of the comment that will be evaluated will the “1” part of “A1C”, not the actual value of 8.5. It is strongly suggested that if you are using this function that you should provide education to the fact that the first part of the comment should be numeric. As with all functions, the BEGINNING DATE/TIME, ENDING DATE/TIME, CONDITION, USE STATUS/COND IN SEARCH fields could significantly impact your results so pay close attention to these entries.
NUMERIC can be also combined with other functions and global variables as below:

NUMERIC(1,1,"COMMENT")>4.0&(MRD(2)<3100909)
NUMERIC(2,2,"COMMENT")<5&(PXRMAGE>60)

CLASS: NATIONAL

**MAX_VALUE**
The MAX_VALUE function returns the maximum value of \( n \) number of occurrences of a specific CSUB or multiple CSUB’s of a single finding or multiple findings. The CSUB that is being requested must be a numeric value. Any CSUB requested that is not numeric will be treated as having a value of zero. For instance, if you want to know the largest A1C result a patient has, you can use the MAX_VALUE function.

The syntax of the function is MAX_VALUE(N,"CSUB")<operator><test value> where N is the finding number. In the above example with A1C, assume the A1C is FI(1), the function would be written as MAX_VALUE(1,"VALUE"). Note that you have to set the occurrence count on FI(1) to a value greater than 1 or you will get the latest (most recent) result. If you wanted to look at the last 20 A1C values and see if the largest value is greater than 10, you would set the occurrence count to 20 on the finding and then use the string MAX_VALUE(1,"VALUE")>10. The function finding will be true if the value returned from MAX_VALUE is greater than 10.

When using the function with multiple findings and CSUB’s, the syntax is a bit more complex. MAX_VALUE(X,"CSUB",Y,"CSUB",Z,"CSUB")<operator><test value>, where X,Y and Z are all separate findings. Again, for each finding, the number of results returned is only up to whatever value is set in the occurrence count of each finding. In this example, the largest value of all findings evaluated is returned and a comparison is made to the test value.

Example: FI(1) is lab test with occurrence count of 5 with the following values:

100
103
98
96
92

The MAX_VALUE(1,"VALUE")>100 would be TRUE because the largest value returned from the last 5 occurrences is 103. If you did not set the occurrence count field entry, then the result would be FALSE because the largest value would be 100.

As with all functions, the BEGINNING DATE/TIME, ENDING DATE/TIME, CONDITION, USE STATUS/COND IN SEARCH fields could significantly impact your results so pay close attention to these entries.

MAX_VALUE can be also combined with other functions and global variables as below:

MAX_VALUE(1,"VALUE")>10&(MRD(1,2)>MRD(4))!(COUNT(6)<3)
MAX_VALUE(1,"VALUE")<4.0&(PXRMAGE<40)&(PXRMSEX="F")

CLASS: NATIONAL
**MIN_VALUE**

The MIN_VALUE function returns the minimum value of \( n \) number of occurrences of a specific CSUB or multiple CSUB’s of a single finding or multiple findings. The CSUB that is being requested must be a numeric value. Any CSUB requested that is not numeric will be treated as having a value of zero. For instance, if you want to know the smallest A1C result a patient has, you can use the MIN_VALUE function.

The syntax of the function is MIN_VALUE(N,"CSUB")<operator><test value> where \( N \) is the finding number. In the above example with A1C, assume the A1C is FI(1). The function would be written as MIN_VALUE(1,"VALUE”). Note that you have to set the occurrence count on FI(1) to a value greater than 1 or you will get the latest (most recent) result. If you wanted to look at the last 20 A1C values and see if the smallest value is greater than 10, you would set the occurrence count to 20 on the finding and then use the string MIN_VALUE(1,"VALUE")>10. The function finding will be true if the value returned from MIN_VALUE is greater than 10.

When using the function with multiple findings and CSUB’s, the syntax is a bit more complex. MIN_VALUE(X,"CSUB",Y,"CSUB",Z,"CSUB")<operator><test value>, where \( X,Y \) and \( Z \) are all separate findings. Again, for each finding, the number of results returned is only up to whatever value is set in the occurrence count of each finding. In this example, the smallest value of all findings evaluated is returned and a comparison is made to the test value.

Example: FI(1) is lab test with occurrence count of 5 with the following values:

- 100
- 103
- 98
- 96
- 92

The MIN_VALUE(1,"VALUE")>99 would be FALSE because the smallest value returned from the last 5 occurrences is 92. If you did not set the occurrence count field entry, then the result would be TRUE because the smallest value would be 100.

As with all functions, the BEGINNING DATE/TIME, ENDING DATE/TIME, CONDITION, USE STATUS/COND IN SEARCH fields could significantly impact your results so pay close attention to these entries.

MIN_VALUE can be also combined with other functions and global variables as below:

\[
\text{MIN}_\text{VALUE}(1,"\text{VALUE}")>10\&(\text{MRD}(1,2)>\text{MRD}(4)!\text{COUNT}(6)<3)
\]

\[
\text{MIN}_\text{VALUE}(1,"\text{VALUE}")<4.0\&(\text{PXRMAGE}<40\&\text{PXRMSEX}="F")
\]

CLASS: NATIONAL
**Status List**

Status List applies only to finding types that have a status:
- Inpatient pharmacy
- Outpatient pharmacy
- Orders
- Problem List
- Radiology
- Reminder Taxonomy
- Reminder Terms

If no Status List is specified, then certain defaults apply:

<table>
<thead>
<tr>
<th>Finding Type</th>
<th>Default Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inpatient Medications</td>
<td>ACTIVE</td>
</tr>
<tr>
<td>Orderable Item</td>
<td>ACTIVE, PENDING</td>
</tr>
<tr>
<td>Outpatient Medications</td>
<td>ACTIVE, SUSPENDED</td>
</tr>
<tr>
<td>Problem List</td>
<td>ACTIVE</td>
</tr>
<tr>
<td>Radiology Procedure</td>
<td>COMPLETE</td>
</tr>
</tbody>
</table>

**Default View** (This example is for a Radiology Procedure as the Finding Item)

Statuses already defined for this finding item:
COMPLETE
Select one of the following:
A  ADD STATUS
D  DELETE A STATUS
S  SAVE AND QUIT
Q  QUIT WITHOUT SAVING CHANGES

Enter response: S// ?
Display when adding a status
Enter response: S// a  ADD STATUS
1 - * (WildCard)
2 - CANCELLED
3 - COM
4 - COMPLETE
5 - EXAMINED
6 - TRANSCRIBED
7 - WAITING FOR EXAM
Select a Radiology Procedure Status or enter '^' to Quit:  (1-7): 2,3,6

Statuses already defined for this finding item:
CANCELLED
COM
COMPLETE
TRANSCRIBED
Select one of the following:
A  ADD STATUS
D  DELETE A STATUS
S  SAVE AND QUIT
Q  QUIT WITHOUT SAVING CHANGES

Enter response: S// ?
View when deleting a status
Enter response: S// d  DELETE A STATUS
Tip: Here is a tip that will make it work a little bit faster when you are using a Condition to check the status. The status is checked before the Condition is applied so if your status list does not contain the status you are checking for in the Condition the Condition will never be true. So when you are using a Condition set the status list to the wildcard “*”, this makes the status check faster.

**Activate/Inactivate Reminders**

Use this option to make individual reminders active or inactive.

Inactivating a reminder will not remove it from CPRS cover sheet lists or health summaries. However when the cover sheet loads or the health summary is run the reminder will not be evaluated and a message showing the date and time the reminder was inactivated will be displayed.
Reminder Sponsor Management

This option provides the functions for Reminder Sponsor Management.

Reminder Taxonomy Management

Reminder taxonomies, stored in file #811.2, provide a convenient way to create a set of coded values and give it a name. For example, the VA-DIABETES taxonomy contains a list of ICD diagnosis codes that signify the patient has a diagnosis of diabetes.

Changes made to Taxonomy Management by Patch 26 (PXRM*2*26)

In the past, taxonomies were based on pointers to the ICD diagnosis file (#80), the ICD Operation/Procedure file (#80.1), and the CPT file (#81). Multiple ranges of codes (low code to high code) could be defined for each of these coding systems. When editing was finished, each range of codes was expanded to include all the codes from the low code to the high code. Some coding systems such as SNOMED CT do not assign any meaning to the codes, so they cannot be grouped by code and the concept of a range of codes is meaningless. In some cases, for coding systems that do support the concept of a range, code set updates have inserted an unrelated code into a range.

New approach: For the above reasons, the PXRM*2*26 patch changes taxonomies so that they are Lexicon-based. This is a general approach that allows Clinical Reminders taxonomies to support any coding system defined in Lexicon’s Coding Systems file (#757.03), provided Lexicon maintains the coding system and patient data using the coding system is stored in VistA.

For each coding system it includes, the Coding Systems file defines a three-character abbreviation, nomenclature, source title, and source. Example: ICD, ICD-9-CM, International Classification of Diseases, Diagnosis, 9th Edition, and US Department of Health and Human Services. The three-character abbreviation provides a convenient way to refer to coding systems and is used by Clinical Reminders Taxonomies. The following coding systems are supported by Clinical Reminders:

<table>
<thead>
<tr>
<th>Abbreviation</th>
<th>Nomenclature</th>
</tr>
</thead>
<tbody>
<tr>
<td>10D</td>
<td>ICD-10-CM</td>
</tr>
<tr>
<td>10P</td>
<td>ICD-10-Proc</td>
</tr>
<tr>
<td>CPT</td>
<td>CPT-4</td>
</tr>
<tr>
<td>CPC</td>
<td>HCPCS</td>
</tr>
<tr>
<td>ICD</td>
<td>ICD-9-CM</td>
</tr>
<tr>
<td>ICP</td>
<td>ICD-9-Proc</td>
</tr>
<tr>
<td>SCT</td>
<td>SNOMED CT</td>
</tr>
</tbody>
</table>

Changes to Reminder Dialogs

Before PXRM*2*26, users created Reminder Dialogs by adding individual ICD-9-CM and/or CPT-4 codes. When using codes as Finding Items or Additional Finding Items in CPRS, the end user didn’t select codes; codes were automatically filed to VistA when the element/group was selected in the Reminder Dialog. If the Reminder Dialog was set up to use a Taxonomy, it could only be used as a Finding Item; it created a pick list of codes for the user to pick from in CPRS.

The display in CPRS was controlled by the set-up in the Reminder Finding Parameter File (#801.45) and the Reminder Taxonomy File (#811.2). These controls determined if the Taxonomy should assign codes to the current encounter or an historical encounter and what prompts should be assigned to the Reminder Dialog in CPRS.
After PXRM®2®26, users will no longer be able to add ICD-9-CM and/or CPT-4 codes to a Reminder Dialog. Users will need to create a Taxonomy, assign codes, and then add the Taxonomy to the Reminder Dialog. To maintain similar end user functionality in CPRS, a new field named Taxonomy Pick List Display has been added to the dialog data dictionary. This field controls how Taxonomies display in CPRS.

When editing a dialog, a simple taxonomy editor is available. It is accessed from dialog management (either the element or group view). Codes added in this editor are automatically marked as Use In Dialog. If a code is deleted in this editor, the Use In Dialog designation is removed from the code.

See the Dialog Management section (page 293) for further explanation of the changes and for examples of using the new Dialog Taxonomy functionality.

Reminder Taxonomy Management

A new taxonomy management system replaces the previous taxonomy management menu. The new system uses a combination of List Manager, ScreenMan, and the Browser. List Manager should already be familiar to users of Clinical Reminders tools such as Dialog Management or Reminder Exchange. ScreenMan and the Browser may not be as familiar, but reviewing Appendix A of this manual or the FileMan documentation should give you enough knowledge to make using the taxonomy management system much easier.

ScreenMan Overview

ScreenMan is VA FileMan's screen-oriented data entry tool. It is an alternative to the Scrolling Mode approach. With ScreenMan, data is entered in forms. Each form field occupies a fixed position on the screen (instead of scrolling off!). You can see many data fields at once, and use simple key combinations to edit data and move from field to field on a screen. You can also move from one screen to another like turning through the pages of a book.

If you are not familiar with how to use ScreenMan, see Appendix A of this manual for a brief overview. For a detailed explanation of using ScreenMan and the Browser, please refer to the VA FileMan Getting Started manual.

Browser Overview

The Browser lets you view any text on the screen instead of on paper. Do this by printing your text to the BROWSER device instead of the HOME device or a printer.

The Browser makes it very easy to view text on screen. Its main features are:

- Scroll forwards and backwards through the text. This means you don't lose lines of text "off the top" of the screen, like you do when you print to the HOME device.
- Use the Search feature to find a text string and immediately jump to occurrences of the search string.
- Copy selected text from the VA FileMan Clipboard; later, if you're editing a mail message or other WORD-PROCESSING-type field with the Screen Editor, you can paste from the clipboard.
Shortcuts and Screen setup Tips

Both the Browser and ScreenMan have shortcuts that can save you a lot of time. Each shortcut begins by pressing the Num Lock (NL) key. (NOTE: some laptops don’t have a NumLock key, so you would need to use Map Keyboard on your Reflections Utility menu to map a terminal key to the PC NumLock key.)

Some Browser actions:
• (NL)B – go to bottom
• (NL)E – exit
• (NL)F – find
• (NL)H – help
• (NL)Q – quit
• (NL)T – go to top

Some ScreenMan shortcuts:
• (NL)C – close a screen
• (NL)E – exit and save changes
• (NL)H – help
• (NL)Q – exit and do not save changes
• (NL)Z – zoom editor

Your Reflections session setup makes a difference in the appearance of the ScreenMan display. The screen element Normal default is a white background and black foreground. Choosing a background color other than white and a foreground color that works well with the background color will provide a more readable ScreenMan display.

![Display Setup](image)

NOTE: For taxonomy inquiry print to display properly in Reflections, the setup must have Save from Scrolling Regions checked. Sequence is: Setup => Display => Screen => Display Memory Advanced.
Reminder Taxonomy Management Main Screen

When you select Taxonomy Management from the Clinical Reminders Managers Menu, you will go into a List Manager Taxonomy Management screen. It lists all of the taxonomies on your system. You can use the standard List Manager actions to search or scroll through the list.
Example: Taxonomy Management main screen

<table>

Reminder Taxonomy Management Actions

<table>
<thead>
<tr>
<th>Synonym</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD</td>
<td>Add</td>
<td>Use this action to create a new taxonomy.</td>
</tr>
<tr>
<td>EDIT</td>
<td>Edit</td>
<td>Use this action to edit an existing taxonomy.</td>
</tr>
<tr>
<td>COPY</td>
<td>Copy</td>
<td>This action allows the user to copy an existing taxonomy into a new one. The new taxonomy must have a unique name.</td>
</tr>
<tr>
<td>INQ</td>
<td>Inquire</td>
<td>Use this action to obtain a detailed report about a taxonomy. It lists all the codes that have been selected, the code’s status, and shows if the code has been marked as Use In Dialog (UID).</td>
</tr>
<tr>
<td>CL</td>
<td>Change Log</td>
<td>Use this action to display a taxonomy’s change log (edit history).</td>
</tr>
<tr>
<td>CS</td>
<td>Code Search</td>
<td>This action can be used to find all taxonomies that include a particular code.</td>
</tr>
<tr>
<td>IMP</td>
<td>Import</td>
<td>Use this action to import codes from a CSV file.</td>
</tr>
<tr>
<td>UIDR</td>
<td>UID Report</td>
<td>This action runs the UID report which displays all inactive codes marked as UID.</td>
</tr>
</tbody>
</table>

*NOTE – KNOWN ANOMALY:
For any action that works with a list, you can select the list and then the action, or select the action and then the list. In the first case, the action uses List Manager’s list selection, which returns the list as a string of items. If the list has too many items, it generates a range error. The workaround is to select the action first.
For example, on the code selection screen, if you do an ICD-10 Lexicon search for diabetes, you will see a list of around 250 codes. If you enter 1-250, you’ll get a range error. However, if you select Add, then you can enter 1-250 and not get the error.

**Lexicon Selection**

<table>
<thead>
<tr>
<th>Term/Code: diabetes</th>
</tr>
</thead>
<tbody>
<tr>
<td>253 ICD-10-CM codes were found.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>+No. Code</th>
<th>Active</th>
<th>Inactive</th>

<td>10/1/2014</td>
<td>Personal History of Diabetes Mellitus</td>
<td></td>
</tr>
<tr>
<td>253 Z86.32</td>
<td>10/1/2014</td>
<td>Personal History of Gestational Diabetes</td>
<td></td>
</tr>
</tbody>
</table>

**Reminder Taxonomy Actions**

**Add**

Use this action to add a new taxonomy.

When you select Add, you are prompted to enter the Name and Class of the new taxonomy. Once these have been entered you will be taken to the ScreenMan edit form. This is the same form you enter when selecting the Edit action.

**Edit**

Use this action to edit the fields in a taxonomy definition. When you select Edit, a ScreenMan form opens.
Taxonomy Fields

<table>
<thead>
<tr>
<th>NAME</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME</td>
<td>This is the name of the taxonomy. It must be unique. Nationally distributed taxonomies start with &quot;VA-&quot;.</td>
</tr>
<tr>
<td>DESCRIPTION</td>
<td>Use this word-processing field to give a complete description of the taxonomy. Topics to consider including are what the taxonomy represents and its intended usage.</td>
</tr>
<tr>
<td>PATIENT DATA SOURCE</td>
<td>Specifies where to search in VistA for patient data. It is a string of comma-separated key words. The list of key words is given below.</td>
</tr>
<tr>
<td>USE INACTIVE PROBLEMS</td>
<td>Applies only to searches in Problem List. Normally inactive problems are not used. However when this field is set to YES, then both active and inactive problems are used. This field works just like the field with the same name that can be specified for a reminder definition finding or a reminder term finding. If this field is defined in the taxonomy, it will take precedence over the value of the corresponding field at the term or definition level.</td>
</tr>
<tr>
<td>PRIORITY LIST</td>
<td>This field applies only to Problem List searches. It can be used to limit the problems that are included to those with the listed priorities. The possible values are: A - acute C - chronic U - undefined Any combination of these letters can be used. For example, 'A' would limit the search to acute problems. 'CU' would include chronic problems and those whose priority is undefined. If this field is left blank then all priorities will be included.</td>
</tr>
<tr>
<td>INACTIVE FLAG</td>
<td>Enter &quot;1&quot; to inactivate the taxonomy.</td>
</tr>
<tr>
<td>TERM/CODE (multiple)</td>
<td>Term/Code and a Coding System are passed to the Lexicon search utility, which returns a list of codes based on the users search criteria. Terms are descriptions for a concept and the code is a unique identifier assigned to that description. A concept can have one or more descriptions to express the concept. An example of this in SNOMED CT is the concept code 271807003</td>
</tr>

</table>
**NAME** | **DESCRIPTION**
--- | ---
 | that has a fully specified name of "Eruption of Skin", a preferred name of "Eruption" and several synonyms "Rash", "Skin Eruption", "Skin Rash". For more information, see the Lexicon Utility User Manual.

**CLASS**
This is the class of the entry. Entries whose class is National cannot be edited or created by sites.

N - NATIONAL
V - VISN
L - LOCAL

**SPONSOR**
This is the name of a group or organization that sponsors the taxonomy.

**REVIEW DATE**
The review date is used to determine when the entry should be reviewed to verify that it is current with the latest standards and guidelines.

**CHANGE LOG**
If changes were made, the date and the name of the user making the changes will be inserted automatically. You can optionally type in a description of the changes made during the editing session.

### Patient Data Source Keywords

<table>
<thead>
<tr>
<th>KEYWORD</th>
<th>MEANING</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL</td>
<td>All sources (default)</td>
</tr>
<tr>
<td>EN</td>
<td>All PCE encounter data (CPT-4 &amp; ICD diagnosis)</td>
</tr>
<tr>
<td>ENPP</td>
<td>PCE encounter data, principal procedure (CPT-4) only</td>
</tr>
<tr>
<td>ENPD</td>
<td>PCE encounter data, principal diagnosis (ICD) only</td>
</tr>
<tr>
<td>IN</td>
<td>All PTF inpatient data (ICD diagnosis and procedures)</td>
</tr>
<tr>
<td>INDXLS</td>
<td>PTF inpatient DXLS diagnosis (ICD) only</td>
</tr>
<tr>
<td>INM</td>
<td>PTF inpatient diagnosis (ICD) movement only</td>
</tr>
<tr>
<td>INPD</td>
<td>PTF inpatient principal diagnosis (ICD) only</td>
</tr>
<tr>
<td>INPR</td>
<td>PTF inpatient procedure (ICD) only</td>
</tr>
<tr>
<td>PL</td>
<td>Problem List (ICD diagnosis and SNOMED-CT)</td>
</tr>
<tr>
<td>RA</td>
<td>Radiology (CPT-4) only</td>
</tr>
</tbody>
</table>

You may use any combination of these keywords. An example is EN,RA. This would cause the search to be made in V CPT and Radiology for CPT-4 codes. If PATIENT DATA SOURCE is left blank, the search is made in all the possible sources. You can also use a “-” to remove a source from the list; for example, IN,-INM.

It is important to remember that the link between CPT-4 codes and radiology procedures is maintained by sites. If this linkage is not kept current at your site then the recommendation is do not use RA in Patient Data Source. It will be much more reliable to use radiology procedures directly as findings.

When you navigate to some of the fields on the form, you may see help in the command area. If more detailed help is needed, type ‘?’ or ‘??’.

Term/Code is a multiple of terms, codes, or code fragments that are used for a Lexicon search. In the above example, the code fragment 250 has been entered. When you press Enter you will be taken to a form where you select the coding system to search.
Example: Coding System Selection Form

![Coding System Selection Form](image)

The top line displays the Term/Code that will be used in the search. You can scroll through the list to select a coding system for the search. When the cursor is on a coding system and you press Enter, the Term/Code and the coding system are passed to the Lexicon search engine, which returns a list of matching codes. The codes are displayed in a List Manager screen. At the top it shows you Term/Code and the number of codes found in the selected coding system.
Example: List Manager Lexicon Selection Screen

This example shows the results of a search for the Term/Code 250 in the ICD-9-CM coding system. The second line shows the Term/Code and the third line the number of codes found in the selected coding system.

At this point, the following actions are available:

<table>
<thead>
<tr>
<th>Synonym</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD</td>
<td>Add to taxonomy</td>
<td>Adds the selected codes to the taxonomy.</td>
</tr>
<tr>
<td>RFT</td>
<td>Remove from taxonomy</td>
<td>Removes the selected codes from the taxonomy.</td>
</tr>
<tr>
<td>RFD</td>
<td>Remove from dialog</td>
<td>Removes UID from the selected codes.</td>
</tr>
<tr>
<td>UID</td>
<td>Use in dialog</td>
<td>Marks the selected codes as Use in Dialog.</td>
</tr>
<tr>
<td>SAVE</td>
<td>Save</td>
<td>Saves the results of the other actions. You may do multiple adds, removes, etc., but nothing is actually saved until the Save action is performed.</td>
</tr>
</tbody>
</table>

Note: You may select the action first, then the list of entries it applies to, or the list of entries and then the action. There are a number of ways to specify the selection list.

- Comma separated list of entries
- Range of entries
- Combination

When you are finished, use the hidden action Quit to return to the coding system selection form. If desired, you can use the same Term/Code for searching another coding system, just move to the next coding system and press Enter. If you want to input another Term/Code then use either shortcut (NL)C (close) or (NL)Q (quit) to exit the coding system selection form and return to the main taxonomy edit form.

To edit some fields, such as Description, you must press Enter, and then a word-processing screen opens:
• To exit the word-processing screen, press <PF1>E (or the key you’ve mapped).

• Move down the edit screen by using the down arrow.
Copy

Use this action to copy an existing taxonomy definition into a new entry. Once the taxonomy has been copied, you have the option of editing it.

Example: Copying a taxonomy definition screen

If you choose to edit the taxonomy you’ve copied, you will enter the standard editing form.
Example: Standard Editing form

Code Search

This lets you find all taxonomies that contain a particular code. When you select this action, you are prompted to input a code from any of the supported coding systems. You only need to enter the code; the coding system will be automatically determined.

Example: Selecting Code Search screen
Example: Code Search Results

Input a code to search for: 250.03
Searching for ICD-9-CM code 250.03
ICD-9-CM 250.03 is used in the following taxonomies:
  ASP TEST
  CAMP-DIABETES HGBA1C
  DIABETES
  HIGH RISK FOR FLU/PNEUMONIA
  HIGH RISK, HIGH LDL
  ICD9 250.03
  JP-DIABETES
  KC TEST
  MIKE HI RISK FLU/PNEUMONIA
  ML DIABETES
  NCG DIABETES
  SBY-CHEY-HI RISK FLU/PNEUMONIA
  VA-DIABETES
  VA-HIGH RISK FOR FLU/PNEUMONIA
  VA-HIGH RISK FOR INFLUENZA
  VA-HIGH RISK FOR PNEUMOCOCCAL DZ

Input a code to search for: 250.03
Import

The Import action provides an easy way to import lists of codes into a taxonomy.

A CSV file (Comma Separated Values) is created from a spreadsheet. The first column is equivalent to the Term/Code, the second column is the three-character coding system abbreviation for one of the supported coding systems, and the rest of the columns are the codes to be imported for the Term/Code, coding system pair. The spreadsheet can have multiple rows, a row for each Term/Code, coding system, set of codes to be imported. The final step is to create a CSV file (comma-delimited text file), using the Save As action.

NOTE: The National Library of Medicine (NLM), in collaboration with the Office of the National Coordinator for Health Information Technology and the Centers for Medicare & Medicaid Services has created a Value Set Authority Center (https://vsac.nlm.nih.gov/). These value sets contain lists of terms and their codes and they can be useful for creating taxonomies.

The Import action facilitates their use by allowing import of the codes into a taxonomy. To prepare the data for import, the original spreadsheet should be copied into a new spreadsheet that can be edited.

Example Spreadsheet

When the Import action is selected, you will be prompted to select a taxonomy to import into, and after it has been selected, you have the following choices:
Import: CSV Host File
If the CSV file has been saved as a host file, choose the HF option. You will then be prompted for a path. This is the directory/folder that contains the CSV file and it must be accessible from your VistA session. A list of all files with a `.CSV` extension in that directory will be displayed; enter the file name at the prompt, (you do not need to include the .csv extension).

NOTE: Special privileges are required to access host file directories, so you may not be able to use this option.

Example: Importing codes from a CSV host file

At this point you will have the option of browsing the list of codes.
Example: Browsing list of codes screen
If you are satisfied, then when the Browser is exited, respond yes to this prompt:

**Do you want to save the imported codes? Y//**

If there are problems with any of the codes, error messages will be displayed.

When the codes are imported into the taxonomy, each Term/Code will have “(imported)” appended to it so that you will know the codes were imported.
Import: CSV Paste
Another way to import a CSV file is the PA option. When you use this option, you open the CSV file on your workstation and copy it.

1. Create an Excel Spreadsheet. The first column of the new spreadsheet is equivalent to the Term/Code, the second column is the three-character coding system abbreviation for one of the supported coding systems, and the rest of the columns are the codes to be imported for the Term/Code, coding system pair. The spreadsheet can have multiple rows, a row for each Term/Code, coding system, set of codes to be imported. The final step is to create a CSV file (comma-delimited text file), using the Save As action.

2. Save the imported files as a CSV.
3. Open the CSV file, as a text file, using a text editor such as Notepad or Microsoft Word. (Select All Files in the Files of type box.)

4. Open the desired csv file, and copy the contents so they are ready for pasting.
5. In Taxonomy Management, select the action IMP and press enter.
6. At the prompt, enter the number of the Taxonomy that the import file will be imported to.

7. Select PA for the import method.
8. At the 'Paste the CSV file now prompt, click on Paste from the file menu (or select the Paste icon) and press <enter> to finish.

9. Next you will be given the opportunity to browse the list of codes that will be imported. If you are satisfied with the list, respond ‘Y’ to the following prompt to import the codes:
10. After browsing, you’ll be asked if you want to save the codes.

**Do you want to save the imported codes? Y//**

11. You can also do an inquiry on the taxonomy you imported the codes into, to verify that these have been entered.
### Taxonomy Inquiry

**Import – TAX**
If you choose the TAX option then you will be presented with a list of all the taxonomies on the system and you can create a list of taxonomies to import codes from.
The SEL action adds a taxonomy to the list and the REM action removes it from the list. Once the list is built use the DONE action. You will then see the following prompt for each selected taxonomy:

```
Ready to import codes from taxonomy (taxonomy name here)

Select one of the following:

   ALL       All codes
   SEL       Selected codes

Enter response: ALL//
```

ALL will import all the codes and SEL will walk you through each Term/Coding System combination in the taxonomy and allow you to choose whether or not to import it.
Importing a CSV file from a web site

Hint - If you have the url copied to the clipboard you can paste it at the Input prompt.

Use in Dialog Report (UIDR)

The Use in Dialog Report option searches all taxonomies for inactive codes that are marked as Use in Dialog. If any of these are found, a Browser window displays the taxonomies and information about the inactive code(s) they contain.

Select UIDR from the Taxonomy Selection screen:
Once the report is built a Browser screen will open displaying the report.

Example: Browsing Use in Dialog Report
Code Set Versioning

The Health Insurance Portability and Accessibility Act (HIPAA) stipulates that specific code sets used for billing purposes must be versioned based on the date of service. Those code sets must be applicable at the time the service is provided. Clinical Reminders was required to make changes to ensure that users would be able to select codes based upon a date that an event occurred with the Standards Development Organization (SDO)-established specific code and translation that existed on an event date.

Because of this, when reminder dialogs are processed the user can only select codes that are active on the encounter date. For historical entries the user may select a code that is currently inactive, but was active on the date of the historical encounter. In practical terms, this means that you may want to leave codes that have been recently inactivated marked as Use in Dialog (UID), but remove UID from codes that were inactivated some time ago.

Taxonomies are another matter; even though a code has been inactivated, it probably should still be left in the taxonomy, because you will still want to be able to find any patients that were given the code in the past when it was active.

When Lexicon code set updates are installed it triggers the generation of reports which are sent to the Clinical Reminders mail group defined in file #800. In the past, the content of these reports was based upon the use of expansion in taxonomies and the use of individual codes as findings or additional findings in reminder dialogs. Since expansion is no longer used and individual codes are no longer used in dialogs the content has changed and is much simpler. Now, it is very similar to the Use in Dialog Report and lists codes which are marked as Use in Dialog but are now inactive. When you receive the messages, review them to see what action should be taken, if any.

Example : Code Set Update Message

```
Subj: Clinical Reminder taxonomy updates, ICD global was updated.  [#95437]
11/27/12@15:32  159 lines
From: XXXXX,YYY (Yyy Xxxxxxx)  In 'IN' basket.   Page 1
-------------------------------------------------------------------------------
There was an ICD code set update on 11/27/2012@15:32:39.

The following taxonomies contain the listed inactive codes which are marked as Use in Dialog:

Taxonomy: AGP HYPERTENSION TEST (IEN=219)
  Coding system: ICD-9-CM
  Code      Inactivation  Brief Description
  ---------  ---------------  ------------------
        404.1     10/01/1989    BEN HYPERT HRT/RENAL DIS

Taxonomy: AWAT CPT AND POV (IEN=660013)
  Coding system: ICD-9-CM

Please review the affected taxonomies and take appropriate action.

Enter message action (in IN basket): Ignore//
Value Sets

The National Library of Medicine has a Value Set Authority Center (VSAC) web site, where value sets can be obtained. From the web site: “Value sets are lists of specific values (terms and their codes) derived from single or multiple standard vocabularies used to define clinical concepts (e.g. patients with diabetes, clinical visit, reportable diseases) used in quality measures and to support effective health information exchange.” These value sets cover many clinical areas of relevance to the VA and since they are very similar to taxonomies they can be used to automatically generate taxonomies.

To introduce value set functionality into VistA, patch PXRM*2*47 added the following files:

- NLM QUALITY MEASURE GROUPS (file #802.3),
- NLM VALUE SET CODING SYSTEMS (file #802.1),
- NLM VALUE SETS (file #802.2).

And on the PXRM MANAGERS MENU it added an option for Value Sets:

<table>
<thead>
<tr>
<th>Select OPTION NAME: PXRM MANAGERS MENU</th>
<th>Reminder Managers Menu</th>
</tr>
</thead>
<tbody>

The List Manager screen lists all the value sets contained in the NLM Value Set file. Since it is List Manager, all the standard List Manager actions such as SL (search list) are available. In addition to the standard List Manager actions, there are these actions:

Create Taxonomy
This action will automatically generate a new taxonomy from a value set. Some value sets contain coding systems that are not supported in taxonomies so when a taxonomy is generated, these coding systems will not be included. When you select the CT action you are prompted for the value set, after it has been selected the value set is scanned for coding systems that can be imported into the taxonomy, they are listed. The default name for the new taxonomy is the name of the value set; you are given the opportunity to change it. The taxonomy is then created and the code list is populated. The description of the taxonomy will be populated with text stating it was automatically generated from a value set.

Inquire
This action will display the contents of the selected value set. You have the option of a condensed or full inquiry. Both list all the codes in the value set, but in the condensed only the first 57 characters of the
code description are shown while the full inquiry lists the entire description. All the clinical quality measures that use the value set are listed at the end of the inquiry. In the condensed inquiry, only the name of the quality measures is displayed. In the full inquiry, comprehensive information about the quality measures is listed include its name, CMS ID, version number, GUID, NQF number, steward, and description.

Code Search
This action allows you to select from a list of NLM Value Set Coding Systems then input a code from that coding system and it returns a list of all the value sets that contain that code.

In addition to these explicit actions, the standard set of List Manager actions is available, you can see the list by typing “??”. Initially the help for the visible actions is displayed in a FileMan Browser screen, after exiting that screen the hidden action help is displayed. Probably the three most useful actions are:

FS – First Screen
LS – Last Screen
SL – Search List; this is a non-case sensitive search of the text in the List Manager display. It is a convenient way to find value sets that have specified text in their name. You can find all the values sets that contain “mumps” in their name by typing “mumps” at the “Search for:” prompt.
Reminder Term Management

A reminder term provides a way to group findings under a single name, just as a taxonomy lets you group a set of codes under a single name. Each term has a findings multiple that is just like the findings multiple in the reminder definition. When you add findings to this multiple, we call it “mapping” the term. All the findings that are mapped to the term should represent the same concept. The list of possible findings in a term is the same as in a definition, except that a term cannot have another term as a finding.

When a term is evaluated, the entire list of findings is evaluated and the most recent finding is used for the value of the term. If the most recent finding is false (which could happen as a result of a Condition), then the term is false.

A term’s Class can be:
- National (N)
- VISN (V)
- Local (L)

These options are necessary for national guidelines/reporting. The Reminder Term functionality allows you to map local or VISN-level findings to national terms.

</tr>
</tbody>
</table>

List Reminder Terms

This option is used to give a brief listing of reminder terms.
Screening for depression may not be possible in patients with acute medical conditions. This term represents any data element that is used to indicate that the patient has an acute medical condition that prevents screening for depression. E.g. delirium, alcohol hallucinosis, florid psychosis, MI's and other medical emergencies.

Findings: UNABLE TO SCREEN-ACUTE MED CONDITION (FI(1)=HF(107))
Inquire about Reminder Term

This option lets you display the contents of a reminder term in an easy-to-read format.

Add/Edit Reminder Term

You can edit terms or add new ones with this option. If the term is National, you can enter new Findings Items, but can't edit other fields. You can edit any fields for VISN or Local terms.

NOTE: Dates, Conditions, and other data entered for Reminder Terms take precedence over the same data entered in Reminder Definitions.

Review Date:  
Description:  
Findings:  
CN600 (FI(1)=DC(86))
CN609 (FI(2)=DC(395))
CN602 (FI(3)=DC(88))
CN601 (FI(4)=DC(87))
BUSPIRONE (FI(5)=DG(1165))
Give the field USE STATUS/COND IN SEARCH a value of "YES" if you want the STATUS LIST and/or CONDITION applied to each result found in the date range for this finding. Only results that have a status on the list or for which the CONDITION is true will be retained. The maximum number to retain is specified by the OCCURRENCE COUNT.

If the finding has both a STATUS LIST and a CONDITION, the status check will be made first; the CONDITION will be applied only if the finding passes the status check.

**Reminder Term Edit Example**

| Mapping the local finding, HEPATITIS B SURFACE ANTIBODY, to the National term, HBs |
| Select Reminder Term: HBs |
| 1 HBs Ab positive NATIONAL |
| 2 HBs Ag positive NATIONAL |
| CHOOSE 1-2: 1 HBs Ab positive NATIONAL |
| Select Finding: HEPATITIS B SURFACE ANTIBODY |
| FINDING ITEM: HEPATITIS B SURFACE ANTIBODY // <Enter> |
| BEGINNING DATE/TIME: <Enter> |
| ENDING DATE/TIME: <Enter> |
| OCCURRENCE COUNT: 3 |
| This is the maximum number of occurrences of the finding to return. |
| OCCURRENCE COUNT: 3 |
| CONDITION: I (V"POS")!(V="+") |
| CONDITION CASE SENSITIVE: <Enter> |
| USE STATUS/COND IN SEARCH: ? |
| Enter a "Yes" if you want the Status list and/or Condition used in the finding search. |
| Choose from: |
| 1 YES |
| 0 NO |
| USE STATUS/COND IN SEARCH: Yes |
| Choose from: |
| IM HEPATITIS B |
| Finding #: 1 |
| Select Finding: <Enter> |
| Input your edit comments. |
| Edit? NO// <Enter> |
| Select Reminder Term: <Enter> |

**NOTE:** In most cases, a finding modifier on a term takes precedence over the modifier in the definition. An exception to this is the Occurrence Count. The reason for this can be understood by looking at an example. Let’s say a term has been mapped to three findings with an Occurrence Count of 1 for finding 1, 2 for finding 2, and 3 for finding 3. If the maximum number of occurrences is found for each finding, then how do you determine how many occurrences to display? In this case, we would have 6 occurrences, so we have the possibility of displaying anywhere between 1 and 6 of them. The solution is to display the number of occurrences specified at the definition level.
**Copy Reminder Term**

This option lets you copy an existing reminder term into a new one. The new term must have a unique name.

```
Select Reminder Term Management Option: TC  Copy Reminder Term
Select the reminder term to copy: EDUTERM
  Reminder term to copy: EDUTERM
    ...OK? Yes// <Enter>  (Yes)
PLEASE ENTER A UNIQUE NAME: SLC EDUTERM
The original reminder term EDUTERM has been copied into SLC EDUTERM.
Do you want to edit it now? YES
NAME: SLC EDUTERM// <Enter>  
```

If you choose to edit the copied term, the sequence of prompts is the same as those shown under Reminder Term Edit, shown on the previous pages.
Reminder Location List Management

Location Lists provide a way to give a name to a list of locations just as a Taxonomy provides a way to give a name to a list of codes.

When a Location List finding is evaluated, a search is made for a Visit (an entry in the Visit file #9000010) at one of the locations on the list in the specified date range (BEGINNING DATE/TIME, ENDING DATE/TIME).

A Location List is built from two types of entries: Hospital Location, file #44 and Clinic Stop, file #40.7. There is a multiple for Hospital Locations and a multiple for Clinic Stops in the Location List file, so when you build a list of locations, you can use Hospital Locations and/or Clinic Stops.

Clinic Stops are ultimately resolvable to a list of Hospital Locations, so when the search is done, it is all based on the Hospital Location recorded for the Visit. There is a CREDIT STOP (field #2503) associated with each Hospital Location. If there are certain Credit Stops that you want to exclude from the list of Hospital Locations associated with a Clinic Stop, then you put these in the CREDIT STOP TO EXCLUDE multiple for each Clinic Stop in the Location List.

Examples:

a) A Location List for primary care clinics can be created that searches for clinics with stop code 323 and excludes any 323 clinic associated with credit stop 710 (Flu shot only).

b) A Location List for Cardiology clinics can be created that searches for clinics with stop code 303 and excludes any 303 clinic associated with credit stop 450 (used for a clinic dedicated to compensation and pension examination).

**Reminder Exchange**

The Clinical Reminders Exchange Utility provides a mechanism for sharing reminder definitions and dialogs among sites throughout the VA or among sites within a VISN. Exchanging reminders helps to simplify reminder and dialog creation. It also helps to promote standardization of reminders based on local, VISN-wide, and national guidelines.

An effective way to use the Exchange Utility is through VISN web sites. You can put a set of “packed reminders” into a host file, and the host file can be posted on a web site for download.

**NOTE:** Some of the Reminder Exchange options require programmer access (@).

Reminder Exchange allows the exchange of clinical reminders and reminder dialogs from test account to production, between sites, and within VISNs.

**Repack**

This option allows a user to recreate a file entry without re-selecting all of the selection items again. Once a user selects an Exchange file entry to repack, Reminder Exchange will perform the same checks as creating an Exchange file by hand.

Changes made with PXRM*2.0*45
```
• Reminder Exchange will now write a string of dots, instead of the reminder component name when installing the component.
  o Reminder Exchange will only display a component if a user needs to take an action on the component.
• Reminder Exchange will remember the user selection for replacing a finding item not included in the Exchange file entry and automatically use the replacement selection again if the same finding item is used in other reminder components in the Exchange file entry.
• Repack options allows the Reminder Manager to repack an existing exchange file without having to re-select all the selection items again.
• Reminder Exchange re-order the Reminder Components Install Order to prevent the user having to re-install Reminder Dialog Definitions multiple times
• Reminder Exchange will auto-convert Reminder Dialogs that contain branching logic to the new structure if the dialog was packed up before PXRM*2.0*45

Changes made by patch 26

• Automatic packing of the source reminder for a dialog was removed.
• Finding lookup in Reminder Exchange was enhanced to handle mnemonic indexes. An example is the Laboratory Test file #60’s Synonym field in the 'B' index. If two entries had the same Synonym and the .01 of one of the entries was identical to the Synonym, the lookup would fail and a duplicate warning message was issued. The code was changed to examine all the entries in the 'B' index and compare the .01 for each of them with the name Exchange is trying to find. If there is a single exact match of the name and a .01, the name is resolved and no duplicate warning will be given. If more than one .01 is identical to the name, the warning will still be given. Remedy ticket #783078.
• The selection range for the Reminder Exchange actions CHF, CMM, DFE, and IFE was changed so that it includes all Exchange file entries, not just those that are visible.
• For some entries in the Reminder Exchange file displaying installation history details for the first install was giving the following undefined error:  
  <UNDEFINED>DDISP+31^PXRMEXIH ^PXD(811.8,29,130,1,1,"B",0)  
  This happened for old entries for which the 'B' index on the Component List was never cleaned up. The unused indexes are removed.
• Reminder Exchange was updated to handle dialogs that were packed prior to patch 26. If the dialog contains codes, Reminder Exchange will create a new taxonomy when the dialog is installed. It will also replace the codes in the dialog with the new taxonomy. If the dialog contains a taxonomy, Reminder Exchange will update the new fields in the dialog file with the values from the installing site’s Finding Parameters File. Because of these changes, the checksum of the installed dialog will always be different than the checksum of what is in the Exchange file.
• In the past, we have encountered problems, especially with Reminder Exchange, caused by using the tilde (~) character in the name of a reminder component. Reminder Exchange was modified to be able to handle the problem, but to prevent unforeseen problems from happening in the future, the input transform used for all the Clinical Reminders .01 fields was modified to not allow “~”.

NOTE: If you think that “~” may have been used in the .01 of a reminder component at your site, you can use FileMan to find any such entries. There are two possible approaches. One is to use
the verify fields function on the FileMan utilities menu and the other is to use the search function to search for any .01 fields that contain “~”.

- The ability to load a Reminder Exchange prd file from a web site has been added. This can be used in conjunction with the Import from a Web site feature in Taxonomy Management. Note that the https protocol is not supported; only http works. Also, SharePoint sites cannot be accessed because that requires the user’s Windows credentials and they are not available in VistA.

**Terminology**

**Packing:** When you create an Exchange File entry, you select one or more reminder component entries for packing. The packing process consists of going through the selected entries and building a list of everything they need to function. The entire list of items is included in the Exchange File entry. For example, if a reminder definition is being packed everything the definition needs to function is included. Some of the included components may not be transportable for various reasons such as being standardized, they will be included in the Exchange File entry so that we know they are used but they will not be installable.

**Exchange File (#811.8):** Stores entries of packed reminders and dialogs with their components. Packed reminders can be exchanged through VistA MailMan or as a Host file. The default host file extension is .PRD (Packed Reminder Definition).

**VistA MailMan:** Allows users to send the packed reminder via a VistA mail message. When sites are collaborating on development of new reminders and dialogs, messages containing reminders, dialogs, or other reminder components may be sent between sites for loading into the Clinical Reminders Exchange File (#811.8).

**Host File:** Often the domains for MailMan transmission for test accounts are closed. In this case, a host file is used to transport the packed reminders. When a host file is created, it is initially stored on the MUMPS server. (Host file is the terminology used in Kernel.) Typically, you would generate a host file for use on a web site. The Host File will have to be moved from the MUMPS server to the web server. Once it is on the web server, it can be downloaded the LWH action.

**Technical Overview**

In the Reminder Exchange utility, entries are packed into the Exchange File (#811.8) in XML format. Host file or MailMan messages can then be created from the Exchange File for distribution to other sites. Each host file or MailMan message may contain several packed entries. When the receiving site loads a host file or MailMan message into its Exchange File, all the packed entries in the host file or MailMan message are put into the Exchange File. Different versions of the same packed entry may be stored in the Exchange File. They are differentiated by the Date Packed.

All the components used in the item selected for packing are included. Whenever an installation is done, a history of the installation details is retained in the Exchange File. Reminder dialogs are installed with the disabled field set to “DISABLED IN REMINDER EXCHANGE.” (When you edit the dialog, one of the fields is DISABLE. If this field contains any text, then the dialog is disabled. To enable it, delete the text.)
### Steps to Use Reminder Exchange

#### Summary of Steps
Detailed steps are provided in the following pages.

#### Export Steps

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Decide which items to pack</td>
<td>LR – List Reminder Descriptions and RI – Reminder Inquiry</td>
</tr>
<tr>

A: Steps to Export Reminders

Export Steps

1. Select item

2. Create an Exchange File Entry
   Enter description
   Enter key words

3. Create MailMan Message or Host File
   Enter subject
   Select recipient
Detailed Steps to Export Reminders

1. Select an item that you want to exchange.

2. Create Exchange File Entry

Use the action CFE – Create Exchange File Entry to create and load packed entries into the Exchange File (#811.8). This allows selection of a reminder component and entry of a description and keywords to be stored in the Exchange File. If a single item is selected the description will be initialized with the description from the item. You may edit it as necessary.

Select a file: (1-13):
3a. CHF-Create Host File

Use this action to create a host file containing selected entries from the Exchange File (#811.8).

A host file is any file that is stored in your site’s local “host” directory or system. A complete host file consists of a path, file name, and extension. A path consists of a device and directory name. The default extension is PRD (Packed Reminder Definition). Your default path is determined by your system manager. If necessary, contact your IRM to learn how host files work at your site.

Example of a valid path:
USER$:[TEMP]

<table>
<thead>
<tr>
<th>Clinical Reminder Exchange</th>
<th>Apr 02, 2004@11:21:47</th>
<th>Page: 1 of 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exchange File Entries.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Entry</td>
<td>Source</td>
<td>Date Packed</td>

<tr>
<td>1  BLOOD PRESSURE CHECK</td>
<td>CRPROVIDER,ONE@VAMC1</td>
<td>03/28/2004@13:12:26</td>
</tr>
<tr>
<td>2  SLC PNEUMOCOCCAL VACCINE</td>
<td>CRPROVIDER,TWO@VAMC2</td>
<td>03/29/2004@11:55:11</td>
</tr>
<tr>
<td>3  VA-CHOLESTEROL SCREEN (M)</td>
<td>CRPROVIDER,SIX@VAMC6</td>
<td>03/27/2004@14:59:42</td>
</tr>
<tr>
<td>4  VA-ADVANCED DIRECTIVES EDUC</td>
<td>CRPROVIDER,TEN@VAMC10</td>
<td>03/27/2004@14:54:24</td>
</tr>
<tr>
<td>5  VA-HEP C RISK ASSESSMENT</td>
<td>CRPROVIDER,ONE@VAMC1</td>
<td>03/27/2004@14:56:13</td>
</tr>
</tbody>
</table>

Enter a path: USER$:[TEMP]// ?

A host file is a file in your host system.
A complete host file consists of a path, file name, and extension
A path consists of a device and directory name.
The default extension is prd (Packed Reminder Definition).
The default path is USER$:[TEMP]

Enter a path: USER$:[TEMP]// <Enter>

Enter a file name: ?

A file name has the format NAME.EXTENSION, the default extension is PRD
Therefore if you type in FILE for the file name, the host file will be
USER$:[TEMP]FILE.PRD

Enter a file name: DiabeticEye
Will save reminder to host file USER$:[TEMP]DiabeticEye.PRD?: Y//<Enter> ES
3b. CMM-Create MailMan Message

Use this action to create a MailMan Message containing selected entries from the Exchange File (#811.8).

<table>
<thead>
<tr>
<th>Entry</th>
<th>Source</th>
<th>Date Packed</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>

B. Steps to Import Reminders

NOTE: After the installation of PXRM*2*26, you will also be able to load .prd files from a web site, using LWH – Load Web Host File.

1. Request packed entry

2. Receive Mailman Message
   Usually in Production

3. Forward Mailman Message
   To test account (if necessary)

4. Load MailMan message
   Creates entry
1a. LMM – Load MailMan Message

This option lets you load a MailMan message containing packed entries into your site’s Exchange File (811.8).

Loading MailMan message number 44024

1b. LHF – Load Host File

This action lets you load a host file containing packed entries into your local Exchange File (#811.8).

NOTE: Programmer access may be required to upload local host files, depending on how local file protections are set.
1c. LHF – Load Web Host File

This action lets you load a file containing packed entries from a web site. When you select this action you are prompted to input the URL for the web site. Note that the https protocol is not supported; only http works. Also, SharePoint sites cannot be accessed because that requires the user’s Windows credentials and they are not available in VistA.

2a. Installing Reminders from the Exchange File

The action IFE allows a packed entry to be selected for installation from the Exchange File (#811.8). Details of the Exchange File entry are displayed. Individual components are displayed (grouped by type). All or individual components may be selected for installation.
CAUTION: Before starting an installation, you should examine the list of components in the packed entry and determine which ones already exist on your system. You should decide what you are going to do with each component and have a plan of action before proceeding with the installation.

REMINDER TERM entry TERMTEST6 already EXISTS, what do you want to do?

Select one of the following:
C         Create a new entry by copying to a new name
I         Install or Overwrite the current entry
Q         Quit the install
S         Skip, do not install this entry

Enter response: S// C reate a new entry by copying to a new name

Exchange File Components     Aug 24, 2009@11:19:18     Page:    1 of    3

Component                                             Category     Exists
Source:      CRMANAGER@VAMCXXXX
Date Packed: 08/12/2009@11:07:26
Package Version: 2.0P12

Description:
Patient reminder due on anyone with 2 entries of a diagnosis of HTN in the past 3 years. This reminder does not resolve. Additional text is displayed to the patient if the last 3 BPs were <= 130/80, if the last BP was >140/90 or if any of the last 3 BPs was >=160/100.

If you use a different taxonomy for HTN or for renal diseases, you can substitute you local taxonomies into the national reminder term.

Keywords:

Components:

GMRV VITAL TYPE
BLOOD PRESSURE                      X

REMINDER SPONSOR
  1 VA National Center for Health Promotion and Disease Prevention (NCP)
  2 Office of Quality & Performance    X
  3 National Clinical Practice Guideline Council X

REMINDER TAXONOMY
  4 VA-DIABETES  X
  5 VA-HYPERTENSION                     X

REMINDER TERM
  6 VA-BP >130/80 (ANY OF LAST 3)
  7 VA-BP >=160/100                      X
  8 VA-BP >=140/90                       X
  9 VA-MHV DIABETES OR KIDNEY DISEASE   X
 10 VA-MHV HYPERTENSION DX              X

REMINDER DEFINITION
  11 VA-MHV HYPERTENSION                X

The “Exists” column indicates the component’s existence on the system based on identical names. When any component that already exists is selected for installation, a checksum will be computed for the already installed version and it will be compared to the checksum of the component in the Exchange file.
If the check sums are identical, then the components are identical and the component will be automatically skipped.

The “Category” column applies to health factors to indicate whether or not the health factor defines a category. If it does, it must be installed before any health factors that belong to that category.

NOTE: Some findings, such as lab tests, are not transportable. These findings will be in the component list, as they are used by the definition or dialog, but you will not be able to select them for installation. Non-selectable findings will not have a number. When you install a definition or a dialog that uses a non-transportable finding, you will be prompted to enter a replacement. If it is a lab test, enter the name of the equivalent lab test at your site. The replacement item must match the finding type. A lab test cannot be replaced with anything but a lab test.

If a component is selected for installation, it may be installed without change, or copied to a new name. When installing reminder definitions or dialogs, if a component contained within the definition or dialog is missing from your system, you will be prompted to supply a replacement.

NOTE: Because computed findings contain executable code, programmer access (@) is required to install them.

When installing a reminder term the option looks like this:

REMINDER TERM entry TEST TERM already EXISTS,
what do you want to do?

Select one of the following:
C  Create a new entry by copying to a new name
M  Merge findings
O  Overwrite the current entry
Q  Quit the install
S  Skip, do not install this entry

Enter response: S//

The merge option will preserve the existing mapping and will merge any additional findings that are in the packed entry.

2b. Installing a Reminder Dialog

If a reminder dialog is selected for installation, details of the dialog are displayed. The entire dialog or individual components of the dialog (e.g. dialog groups or sub-groups) may be installed.
NOTE: Order dialogs (quick orders) will be treated like findings that are not transportable, such as lab tests. They will appear in the list, as they are used by the dialog; however, they will not be selectable for installation. When you install the dialog, you will be given the opportunity to replace the quick order with a local one or to delete it from the dialog.

Other views may be selected:

DD Dialog Details – displays dialog summary plus any PXRM type additional prompts.

DF Dialog Findings – displays the findings associated with each dialog component and if the finding already exists on the system.

DT Dialog Text – displays the dialog question text for each component. This gives a preview of how the dialog will display in CPRS.

DU Dialog Usage – displays any other existing reminder dialogs using these components.

The reminder dialog or dialog component may be installed from any view in the same manner as other reminder components. Dialog components may be installed or copied to a new name.

3. Quick Install of Reminder Dialogs

If the reminder dialog and all components are new (or exist already), you can use a quick install option. If only some of the components exist, you will be stepped through them individually. Note that if a dialog is installed without the reminder definition, the option is given to link the dialog to an existing reminder.

Tips for exchanging reminders
- Try at least one simple one first – and check the dialog!
- A Category for a health factor must exist to install the health factor.
- To use your own finding in a reminder you are importing, use the SKIP option. Then when the reminder is installed, you will be prompted for the finding to use in the reminder.
- Review local findings carefully.
- Allow dedicated time.
- Review the findings (terms, taxonomies).
- Document in your reminders what your intent and logic were in making it.
- Remember: When you import a reminder, it is YOURS.
- Some sites have Web pages set up for review – use the web before requesting reminders.
- Test!

NOTE: Reminder Exchange Tip

If you try to exchange a location list from one system to another and there is an inconsistency or mismatch between systems in the AMIS stop code, you will get the following error message. (In this case the system has two selectable entries for stop code 560, which will need to be corrected.)

REMINDER LOCATION LIST entry NEXUS STOP CODES FY05 is NEW, what do you want to do?
Select one of the following:

C  Create a new entry by copying to a new name
I  Install
Q  Quit the install
S  Skip, do not install this entry

Enter response: i  Install
Name associated with AMIS stop code does not match the one in the packed reminder:
AMIS=560
Site Name=ZSU SUBSTANCE ABUSE - GROUP
Name in packed reminder=SUBSTANCE ABUSE - GROUP
The update failed, UPDATE^DIE returned the following error message:
MSG("DIERR")=1^1
MSG("DIERR",1)=701
MSG("DIERR",1,"PARAM",0)=3
MSG("DIERR",1,"PARAM",3)=GYNECOLOGY
MSG("DIERR",1,"PARAM","FIELD")=.01
MSG("DIERR",1,"PARAM","FILE")=810.90011
MSG("DIERR",1,"TEXT",1)=The value 'GYNECOLOGY' for field CREDIT STOP TO EXCLUDE in CREDIT STOPS TO EXCLUDE SUB-FIELD in CLINIC STOP LIST SUB-FIELD in file REMINDER LOCATION LIST entry NEXUS STOP CODES FY05 did not get installed!
Examine the above error message for the reason.
Reminder Test

Before a new or modified reminder is put into production, it should be thoroughly tested. The Reminder Test option provides a convenient tool that can be used as an aid in setting up new reminders and tracking down problems with existing ones. It lets you run a reminder without going through CPRS or Health Summary.

The output from the Reminder Test option provides a view of the internal workings of the clinical reminders software and allows you to see what happened as the reminder was evaluated. Errors and warnings that are not always seen on the Clinical Reminder Maintenance output are displayed here. When setting up a reminder, it’s a good idea to have test patients with known clinical data such as examinations, immunizations, ICDs, CPTs, etc., that are pertinent to the reminder being developed. Using this option to run the reminder for test patients allows you to see if the reminder operates as expected.

You should have patients who are in the cohort and who are not in the cohort. For patients who are in the cohort, you should have some who have the reminder resolved and some who do not. It is very useful to have the output from the Reminder Inquiry option available when using the test option.

Here is the inquiry for a reminder called EDUTEST.

Select Reminder Definition Management Option: RI Inquire about Reminder Definition
Select Reminder Definition: EDUTEST

Reminder Test Explained

There are three sections in this output. We will go through them individually.

1. The first section is the FIEVAL (Finding EVALuation) array, which corresponds to the findings in the reminder definition. If we look back at our definition inquiry, we see there are 6 findings in this reminder.

   - Five Education Topics
   - One Reminder Term

The entries in FIEVAL(1) show us what was found for finding 1:

The elements of the FIEVAL array are:

```
FIEVAL(1)=1
FIEVAL(1,1)=1
FIEVAL(1,1,"COMMENTS")=
FIEVAL(1,1,"CSUB","COMMENTS")=
FIEVAL(1,1,"CSUB","DATE")=2980700
FIEVAL(1,1,"CSUB","LEVEL OF UNDERSTANDING")=
FIEVAL(1,1,"CSUB","VALUE")=
FIEVAL(1,1,"CSUB","VISIT")=3935
FIEVAL(1,1,"DAS")=200
FIEVAL(1,1,"DATE")=2980700
FIEVAL(1,1,"LEVEL OF UNDERSTANDING")=
FIEVAL(1,1,"VALUE")=
FIEVAL(1,1,"VISIT")=3935
FIEVAL(1,2)=1
FIEVAL(1,2,"COMMENTS")=
FIEVAL(1,2,"CSUB","COMMENTS")=
FIEVAL(1,2,"CSUB","DATE")=3000000
FIEVAL(1,2,"CSUB","LEVEL OF UNDERSTANDING")=
FIEVAL(1,2,"CSUB","VALUE")=
FIEVAL(1,2,"CSUB","VISIT")=3997
FIEVAL(1,2,"DAS")=212
FIEVAL(1,2,"DATE")=3000000
FIEVAL(1,2,"LEVEL OF UNDERSTANDING")=
FIEVAL(1,2,"VALUE")=
FIEVAL(1,2,"VISIT")=3997
```
NOTE: When a Reminder Test is run, some elements of the FIEVAL array have a “CSUB” subscript. Example for an orderable item finding:

```
FIEVAL(1,3) = 1
FIEVAL(1,3, "COMMENTS") =
FIEVAL(1,3, "CSUB", "COMMENTS") =
FIEVAL(1,3, "CSUB", "DATE") = 3000202.15
FIEVAL(1,3, "CSUB", "LEVEL OF UNDERSTANDING") = 3
FIEVAL(1,3, "CSUB", "VALUE") = 3
FIEVAL(1,3, "CSUB", "VISIT") = 3693
FIEVAL(1,3, "DAS") = 159
FIEVAL(1,3, "DATE") = 3000202.15
FIEVAL(1,3, "LEVEL OF UNDERSTANDING") = 3
FIEVAL(1,3, "VALUE") = 3
FIEVAL(1,3, "VISIT") = 3693

FIEVAL(1,4) = 1
FIEVAL(1,4, "COMMENTS") =
FIEVAL(1,4, "CSUB", "COMMENTS") =
FIEVAL(1,4, "CSUB", "DATE") = 3000217.085926
FIEVAL(1,4, "CSUB", "LEVEL OF UNDERSTANDING") = 3
FIEVAL(1,4, "CSUB", "VALUE") = 3
FIEVAL(1,4, "CSUB", "VISIT") = 3720
FIEVAL(1,4, "DAS") = 151
FIEVAL(1,4, "DATE") = 3000217.085926
FIEVAL(1,4, "LEVEL OF UNDERSTANDING") = 3
FIEVAL(1,4, "VALUE") = 3
FIEVAL(1,4, "VISIT") = 3720
FIEVAL(1, "COMMENTS") =
FIEVAL(1, "CSUB", "COMMENTS") =
FIEVAL(1, "CSUB", "DATE") = 2980700
FIEVAL(1, "CSUB", "LEVEL OF UNDERSTANDING") =
FIEVAL(1, "CSUB", "VALUE") =
FIEVAL(1, "CSUB", "VISIT") = 3935
FIEVAL(1, "DAS") = 200
FIEVAL(1, "DATE") = 2980700
FIEVAL(1, "FILE NUMBER") = 9000010.16
FIEVAL(1, "FINDING") = 1: AUTEDI:
FIEVAL(1, "LEVEL OF UNDERSTANDING") =
FIEVAL(1, "VALUE") =
FIEVAL(1, "VISIT") = 3935
```

200 is the DA string in the Patient Education file/education topic (see the Clinical Reminders Index Technical Manual for info on the DA strings.)
FIEVAL(5,"CSUB","DURATION")=1774
FIEVAL(5,"CSUB","ORDER")=3366^CA ULTRA^546;99RAP
FIEVAL(5,"CSUB","RELEASE DATE")=3010917.1625
FIEVAL(5,"CSUB","START DATE")=3010917
FIEVAL(5,"CSUB","STATUS")=PENDING
FIEVAL(5,"CSUB","STOP DATE")=
FIEVAL(5,"CSUB","VALUE")=PENDING

Each of the subscripts following “CSUB” may be used in a Condition (hence the abbreviation Condition SUBscript). For example:

I V("DURATION")>90

The use of “CSUB” data has expanded beyond Condition statements.

Below is a snippet of how the evaluation appears if “Yes” is entered at the prompt “Display all term findings”. Note that this is not the complete reminder test output. Only the vital parts of the reminder test output are displayed here, to save on space. In a live situation, you will have the entire reminder test output displayed, which can be lengthy.

```
Display all term findings? N// YES

Parts of the reminder test have been removed for brevity’s sake. Under the Term Evaluation part of the reminder test, you will notice the TFIEVAL and subscripts. This looks very similar to the results of the FIEVAL, except that it is the results of each mapped finding within the term. There is a minimum of two subscripts for each mapped finding. The first subscript is the number of the actual finding (the term). The second subscript is the number of the mapped finding. In this instance, the evaluation of the mapped finding is “True.”

\[
\text{TFIEVAL}(1,1) = 1
\]

Sometimes there may be three subscripts. This third subscript is the occurrence of the mapped finding. In the above example (the complete reminder test output), you will notice there are three occurrences for mapped finding number 1. This is because the reminder term has an occurrence count of 3. This is also displayed in the clinical maintenance section of the reminder test output.

**Note:** The “CSUB” values of an occurrence of a mapped finding can be used in a Condition of a finding just as the “CSUB” values of a regular finding can be.
2. This section shows the cohort logic, reminder name, resolution logic, and how the frequency was determined.

The elements of the ^TMP(PXRMID,$J) array are:
^TMP(PXRMID,$J,660020,"PATIENT COHORT LOGIC")=1^ (SEX) & (AGE)^ (1) & (1)
^TMP(PXRMID,$J,660020,"REMINDER NAME")=Education Test
^TMP(PXRMID,$J,660020,"RESOLUTION LOGIC")=0^ (0) !FI(2) & FF(1) & FF(3)^ (0) !160&1
^TMP(PXRMID,$J,660020,"zfREQARNG")=1Y^61^70^Baseline

The first piece of the logic display shows if the logic evaluates to true or false. In this example, the cohort logic is true and the resolution logic is false. The second piece shows the logic string just like it is displayed in the reminder inquiry. The third piece shows the true or false values of the findings in the logic string.

3. The next section shows how the data is returned in ^TMP("PXRHM",$J) to the calling application. This is mainly of interest to developers.

The elements of the ^TMP("PXRHM",$J) array are:
^TMP("PXRHM",$J,660020,"Education Test")=DUE NOW^DUE NOW^unknown
^TMP("PXRHM",$J,660020,"Education Test","TXT",1)=Frequency: Due every 1 year for ages 61 to 70.

Reminder Evaluation in CPRS

Clinical Reminders Managers or clinicians can use the Reminder evaluation utility that’s available in the CPRS GUI to test reminders and dialogs as they are created.

HINT: Keeping one or more terminal emulator (e.g., KEA) screens open with the List Manager Reminder Management menu, along with an open CPRS window, is an effective way to work as you are creating working reminders and dialogs, to ensure that your definitions are appropriate. You can use both the Evaluate Reminder and Refresh options on the Action (or right-click) menu to see the effects of your changes.

There are two forms of the Reminder Evaluation option, for use before and after processing reminders.

Evaluate Reminder

Before you process a reminder, you can select this option to see if specific reminders in the Other Category folder should be Applicable or should be Due for the selected patient.

For example, in a diabetic clinic, you might see a patient around flu season and evaluate the flu shot reminder in the other category to see if a flu shot is needed.

To evaluate reminders, right-click in a tree view (from the Reminders Button or Drawer) and select Evaluate Reminder.

Evaluate Processed Reminders

After you have processed a reminder, you can use this option to see if your actions during the encounter satisfied the reminder.

Satisfying a reminder may require more than you originally think. You may want to evaluate the reminders after you have processed them to make sure you have satisfied the reminder.

NOTE: PCE data may take a few minutes to be correctly recorded. Please wait a few minutes after processing a reminder before evaluating it again to ensure that it was satisfied. To evaluate processed reminders, choose Action in the Available Reminders window, and then click on Evaluate Processed Reminders.
General Testing of Clinical Reminders
The accuracy of clinical display of reminders as well as the accuracy of reports is dependent upon creation and implementation of accurate reminders. One critical role of the reminders champion” is assisting the clinical informatics specialist in testing the reminder.

In this portion of the presentation, I would like to introduce some general concepts of “testing.”. This is not meant to be a detailed instruction manual on testing. I would refer you to the clinical reminders coordinator at your site for more details.

In general, when testing a clinical reminder, you want to test the reminder on patients who fit the cohort definition as well as on patients who do NOT fit the cohort definition. Is the reminder applicable when it should be? You also want to test the reminder for patients who are in cohort and have the reminder resolved as well as for patients who are in cohort and do NOT have the reminder resolved. In the first round, this is usually best done using test patients set up by clinical informatics. This is usually done in a test account which is a mirror image of the production account at your site.

Testing can be done by using the reminder test on an individual patient. The reminder test is a clinical reminders menu option available in Vista which gives detailed information on findings, file locations where the data has been found, logic and other highly technical information. It is generally not understandable by a non-technie.

Most clinicians will find using CPRS to determine if the reminder is due most helpful. The information in the Reminder Maintenance can be analyzed during testing as well as troubleshooting to determine why a specific reminder is due for a specific patient and what resolves the reminder.

An important step is testing the reminder Dialog. The clinician should test all groups and elements in a dialog to ensure that the dialog text is clear, concise, and accurate and that the dialog works as expected. Next, the dialog should be carefully tested to ensure that the progress note text which is inserted is clear, concise, and accurate. Checking the spelling is tedious but important.

The dialog should also be tested to analyze if anything is missing. Think like a clinician: When I see patients in the clinic, which patients obviously can’t have this procedure either because it is impossible or it is not indicated. A clear example is the diabetic foot exam. On first pass, most clinicians would say it’s due for ALL patient with diabetes. However, it is technically not possible to perform a monofilament exam on a patient with bilateral amputees. It is also not clinically useful to perform this exam on a diabetic with a spinal cord injury which has resulted in loss of sensation to the lower extremities. Assuming the reminder passes the testing in the first phase, it is reasonable to move on to a second phase in the test account using reminders reports.

Run detailed reports for short interval in a clinic where you would expect to have the reminder due. For example;

- Diabetes clinic for A1C>9 (Many uncontrolled diabetics would expect to be referred to diabetes clinic)
- Comp and Pension Clinic (high likelihood of patients who are not enrolled in primary care and may not have had reminders addressed)

Run a report listing all patients in the clinic. Check CPRS for accuracy for patients who have the reminder due and who do not have the reminder due.
Run summary and/or detailed reports in a clinic where you expect a specific reminder to be resolved.
Example:

- There is a high likelihood that close to 100% of all patients seen in Retinal clinic have had a retinal examination done.

Another good clinic to check is a primary care provider whom you know to be diligent in processing clinical reminders who also has stable patient panel and is not seeing a lot of new patients.

Clinically review records as needed.
### Other Supporting Menus

This menu and its options are included on the Clinical Reminders Manager Menu to provide easier access to related tools from other VISTA packages for setting up and maintaining clinical reminders.

Reminder Dialog Management

Reminder Dialogs are used in CPRS to allow clinicians to select actions that satisfy or resolve reminders for a patient. Information entered through reminder dialogs update progress notes, place orders, and update other data in the patient’s medical record.

A reminder dialog is created by the assembly of elements in groups into an orderly display, which is seen by the user in the CPRS GUI.

Changes to Reminder Dialogs in Patch 26

Dialogs Will Now Use Taxonomies Exclusively

- Individual codes will no longer be used as findings or additional findings
- Taxonomies for dialogs will be automatically generated
- Name example:
  - ICD9 250.53
- Description:
  - This taxonomy was automatically generated from Reminder Dialog IEN: 5343

- In the past, users created Reminder Dialogs containing ICD-9-CM and/or CPT-4 codes. When using codes as Finding Items or Additional Finding Items in CPRS, the end user didn’t select codes; codes were automatically filed to VistA when the element/group was selected in the Reminder Dialog.
- A Taxonomy could only be used as a Finding Item; it created a pick list of codes for the user to pick from in CPRS. The display in CPRS was controlled by the set-up in the Reminder Finding Parameter File (#801.45) and the Reminder Taxonomy File (#811.2). These controls determined if the Taxonomy should assign codes to the current encounter or an historical encounter. The controls also determined what prompts were assigned to the Reminder Dialog in CPRS.
- New approach: Users will no longer be able to add ICD-9-CM and/or CPT-4 codes to a Reminder Dialog. Users will need to create a Taxonomy, assign codes, and then add the Taxonomy to the Reminder Dialog. To maintain similar end user functionality in CPRS, a new prompt called Taxonomy Pick List Display has been added to the dialog editor. This controls how Taxonomies should display in CPRS.
- When accessing a reminder dialog that contains an inactive taxonomy or a taxonomy that does not match the dialog structure, the taxonomy will not show in CPRS and a MailMan message will be sent to the Clinical Reminders mail group listing the problems with the dialog and the taxonomy.
- New checking functionality has been added. The checker is run automatically when the taxonomy is saved during an editing session, from the dialog checker report, and when packing up a dialog in Reminder Exchange. It will determine if there is a mismatch between a dialog and the taxonomy that is a finding item.
- Reminder dialogs will now allow taxonomies to be used in a group as a finding item. In a group the Taxonomy Pick List Display field can only be set to None, Procedure Only, or Diagnosis Only.
• The patch init conversion routine has been updated to give more detail when updating the dialog file. The conversion routine will also send pre and post-conversion messages listing the details of the dialogs that are being updated.

• Patch PXRM*2*26 will release updates to national dialogs that contain ICD and CPT codes. This also requires new taxonomies for the dialogs. These items will be installed using Reminder Exchange. The name of the Exchange file entry is File “PXRM PATCH 26 DIALOGS UPDATES”.

• When the VA-AAA SCREENING reminder dialog was released in patch PXRM*2*17, it included a new local forced value named ADD TO PROBLEM LIST. Patch PXRM*2*26 changes the forced value to national and renames it to PXRM FV ADD TO PROBLEM LIST.

Changes to Reminder Dialogs in Patch 45

• Branching Logic functionality has been enhanced to support additional actions, and to allow for multiple evaluations. A conversion routine will update the existing branching logic to the new structure
• Reminder Dialog Tester and Checker options have been added to the Reminder Dialog List Manager
• Performance improvements to Reminder Dialog processing
• Reminder Dialog Error Checking in the Editor

Steps to create a dialog

1. First, you create elements, which may include additional prompts, template fields, objects, or orders.
2. Next, organize the elements into groups.
3. Then add the groups or single elements to the dialog.
4. Once a dialog is created, you can link it to a reminder.

It’s possible to autogenerate a dialog, which would automatically incorporate all the defining elements, but would not add informational elements, orderable items, or templates. By manually creating your dialog, you can customize your dialog. Most sites prefer to create dialogs manually.

Reminder dialogs and all their related components are stored in the Reminder Dialog File #801.41. This file is used to define all of the components that work together to define a reminder dialog.

This file contains a combination of nationally distributed entries, local auto-generated entries, site, and VISN exchanged entries, and local manually created entries. Nationally distributed entries have their name prefixed with PXRM or “VA-”. Entries in this file may be auto-generated via the Dialog Management Menu option. Manually created dialog entries should use local naming conventions.

This file is similar to the option file where there are different types of entries (reminder dialog, dialog elements (sentences), prompts, and groups of elements, result elements and groups of result elements). Where an option has menu items, the dialog file has components that are entered with the sequence field as the .01 field.
Dialog Component Definitions

Dialog Elements
A dialog element is defined primarily to represent sentences to display in the CPRS window with a check box. When the user checks the sentence off, the FINDING ITEM in the dialog element and the ADDITIONAL FINDINGS will be added to the list of PCE updates, orders, vitals, mental health tests, and Women’s Health Notifications. The updates won't occur on the CPRS GUI until the user clicks on the FINISH button. Dialog elements may have components added to them. Auto-generated components will be based on the additional prompts defined in the Finding Type Parameters. Once a dialog element is auto-generated, sites can modify them.

Dialog elements may also be instructional text or a header. The FINDING ITEM and components would not be defined in dialog elements.

Dialog Groups
A dialog group is similar to a menu option. It groups dialog elements and dialog groups within its component multiple. The dialog group can be defined with a finding item and check-box. The components in the group can be hidden from the CPRS GUI window until the dialog group is checked off.

Result Elements
The result element is only used with mental health test finding items. A result element contains special logic that uses information entered during the resolution process to create a sentence to add to the progress note. The special logic contains a CONDITION that, when true, will use the ALTERNATE PROGRESS NOTE TEXT field to update the progress note. A separate result element is used for each separate sentence needed. Default result elements are distributed for common mental health tests, prefixed with PXRM and the mental health test name. Sites may copy them and modify their local versions as needed.

Result Groups
A result group contains all of the result elements that need to be checked to create sentences for one mental health test finding and one MH Scale. The dialog element for the test will have its RESULT GROUP field defined with the result group. Default result groups for mental health tests are distributed with the Clinical Reminders package. Sites may copy them and modify their local versions as needed.

Prompts
A prompt is used to have the user enter certain data for the patient. The data that is entered into the prompt will update the progress and the update other files (e.g., PXRM DATE would update the Vist file by creating a new encounter entries for an historical update). Some prompts can be restricted to certain finding items. PXRM WH NOTE TYPE will only work if the finding item or additional finding item is a WH Notification entry.

Forced Value
A forced value is way for forcing a certain type of update. A common use for a forced value is to automatically set a diagnosis as the primary diagnosis.

Dialog Parameters

Before you can create dialogs, the entries in the Dialog Parameters must be appropriate for the dialog you are creating. Although the autogeneration process inserts pre-defined elements from entries in the dialog parameters files, these may not all be appropriate for a specific dialog. Therefore, you should review these dialog parameters and edit them, as necessary.

Health Factor Resolutions

This option is used when creating a reminder dialog from a reminder definition. For reporting purposes, all health factors included in CPRS reminder dialogs must be mapped to a resolution status. This option is used to maintain these mappings. If a health factor is not mapped to a resolution status, it will be ignored by dialog generation (except where an entry exists in the FINDING ITEM PARAMETER file #801.43).

The first screen in this option displays the current mappings:

<table>
<thead>
<tr>
<th>Item</th>
<th>Health Factors</th>
<th>Resolution Status</th>
</tr>
</thead>
<tbody>
<tr>

General Finding Type Parameters (FP)

This option allows display of the REMINDER FINDING TYPE PARAMETER file #801.45 used in generating reminder dialogs. There is limited edit on this file to allow customization of prefix and suffix text. Parameters may also be disabled if not required at your site. The file is structured by finding type and within that resolution status. A generated reminder dialog will include a sentence (dialog element) for each resolution type enabled in the finding type parameter file.

The sentence text is constructed as: prefix_finding item name_suffix. Health factors are treated slightly differently. Health factors are linked to resolution statuses by the Health Factor Resolutions option. For reminders with health factors, sentences are only generated if there is a resolution mapping AND an enabled finding type parameter.

The first screen in this option displays the finding types held in this file:
Selection List May 05, 2000 16:06:40 Page: 1 of 1
Finding Type Parameters

<table>
<thead>
<tr>
<th>Item</th>
<th>Finding Type Parameter</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>9</td>
<td>VITAL MEASUREMENT</td>
</tr>
</tbody>
</table>

When you select an item from this screen, all of the finding type parameters for the finding type selected are displayed. The reminder dialog generation process uses this file to create dialog as follows:

For each finding item on the reminder, the REMINDER FINDING TYPE PARAMETER file is checked to see if there are any “enabled” resolution statuses for the finding type. If an enabled resolution status exists, then a dialog element (sentence) is added to the reminder dialog with sentence text generated from the finding name concatenated with prefix and suffix text.

Example: Patient had ALCOHOL USE education at this encounter

Clicking on the checkbox displayed with this sentence in CPRS causes the finding item (from the original reminder definition) to be posted to this patient’s record.

Additional prompts are also added to the dialog element as specified in the finding type parameter file.

**Note:** Dialog elements created by reminder dialog generation are given a standard name based on the finding type, finding name, and resolution status (from the REMINDER FINDING TYPE PARAMETER file)
Example: ED ALCOHOL USE DONE ELSEWHERE

The dialog elements created are shared by reminder dialogs for reminders with the same finding item.

The example below is the finding type parameter for education findings:

<table>
<thead>
<tr>
<th>Resolution Status</th>
<th>Prefix//Suffix &amp; Prompts/Values/Actions</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 DONE AT ENCOUNTER</td>
<td>Patient had/</td>
<td>Enabled</td>
</tr>
<tr>
<td></td>
<td>/at this encounter</td>
<td></td>
</tr>
<tr>
<td></td>
<td>1] PXRM COMMENT</td>
<td></td>
</tr>
<tr>
<td></td>
<td>2] PXRM LOU (EDUCATION)</td>
<td></td>
</tr>
<tr>
<td>2 DONE ELSEWHERE (HISTORICAL)</td>
<td>Patient indicated/</td>
<td>Disabled</td>
</tr>
<tr>
<td></td>
<td>/was received outside the VA</td>
<td></td>
</tr>
<tr>
<td></td>
<td>1] PXRM COMMENT</td>
<td></td>
</tr>
<tr>
<td></td>
<td>2] PXRM VISIT DATE</td>
<td></td>
</tr>
<tr>
<td></td>
<td>3] PXRM OUTSIDE LOCATION</td>
<td></td>
</tr>
<tr>
<td>3 PATIENT REFUSED</td>
<td>Patient declined/</td>

OVERRIDE PROMPT CAPTION: <Enter>
START NEW LINE: <Enter>
EXCLUDE FROM PN TEXT: <Enter>
REQUIRED: <Enter>
Finding Item Parameters (FI)

This file allows reminder finding items to be linked to a specific dialog element (i.e. sentence and prompts) or a group of dialog elements. The reminder dialog generated for a reminder with a finding item entry in this file will include the dialog element or dialog group specified in this file instead of creating a dialog using the REMINDER FINDING TYPE PARAMETER file.

The first screen in this option displays the finding items held in this file:

<table>
<thead>
<tr>
<th>Selection List</th>
<th>May 05, 2000 10:35:36</th>
<th>Page: 1 of 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Finding Item Parameters</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Item Finding Item Type &amp; Name</td>
<td>Dialog Group/Element</td>
<td>Status</td>
</tr>
<tr>
<td>1 HF-ED SUBSTANCE ABUSE (OVERRIDE)</td>
<td>ED SUBSTANCE ABUSE REFUSED</td>
<td>Enabled</td>
</tr>
<tr>
<td>2 HF-ALCOHOL</td>
<td>ALCOHOL DIALOG GROUP</td>
<td>Disabled</td>
</tr>
</tbody>
</table>

When you select a specific finding item parameter, details of the selected finding item parameter are displayed. You can then edit:

<table>
<thead>
<tr>
<th>Edit List</th>
<th>May 05, 2000 10:48:25</th>
<th>Page: 1 of 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Finding Item Parameter Name: ALCOHOL (ENABLED)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Finding Type: HF(6)</td>
<td>Finding Item: ALCOHOL</td>
<td></td>
</tr>
<tr>
<td>Dialog Group: ALCOHOL DIALOG GROUP (ENABLED)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1) Dialog Element: HF BINGE DRINKING OTHER (ENABLED)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Dialog Text: Binge drinking</td>
<td>Additional Prompts: PXRM COMMENT</td>
<td></td>
</tr>
<tr>
<td>2) Dialog Element: HF DRINKING ALONE OTHER (ENABLED)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Dialog Text: Drinking alone</td>
<td>Additional Prompts: PXRM COMMENT</td>
<td></td>
</tr>
</tbody>
</table>

In the example above, the dialog elements have been previously generated automatically as part of another reminder dialog. A dialog group (ALCOHOL DIALOG GROUP) has then been created in Dialog Edit using these existing dialog elements. Finally an entry has been created in the finding item parameter to link HF(6) to the dialog group.
Reminder Dialogs

Use this option to create and edit Dialog file entries. When you first select the option, all of the available reminders at your facility are listed, with linked dialogs, if they exist, and dialog statuses. You can select a reminder by name or number and then autogenerate a dialog for the reminder or link the reminder to an existing dialog. Alternatively, you can select the action CV Change View, which will allow you to select from any of the following:

Dialog types
- D - Reminder Dialogs
- E - Dialog Elements
- F - Forced Values
- G - Dialog Groups
- P - Additional Prompts
- R - Reminders
- RG - Result Group (Mental Health)
- RE - Result Element (Mental Health)

Reminder dialogs are linked to reminders by a field (REMINDER DIALOG) on the reminder definition. The reminder dialog may be executed by CPRS if the reminder is due or applicable.

A reminder dialog contains questions (dialog elements) and/or groups of questions (dialog groups) that are related to the reminder findings.

Dialog groups can contain one or more questions (dialog elements). Each question (dialog element) may have a number of additional prompts (e.g. date, location) or forced values.

New reminder dialogs can be created using the action, AD - Add Dialog, in the Dialog view. The reminder dialog may be created manually or autogenerated from the reminder definition using the General Finding Type Parameters.

Dialog Edit screen

When you select an existing reminder dialog, the following actions are available:

<table>
<thead>
<tr>
<th>Abbrev</th>
<th>Action Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>#</td>
<td>Select Item</td>
<td>To copy, edit or delete a component in this dialog.</td>

<td>Displays the top-level dialog groups/elements. This option will not display any nested dialog elements or group</td>
</tr>
<tr>
<td>DT</td>
<td>Dialog Text</td>
<td>Displays the dialog text as it should appear in CPRS.</td>
</tr>
<tr>
<td>ED</td>
<td>Edit/Delete Dialog</td>
<td>Edit or delete this reminder dialog. Allows addition and deletion of existing dialog elements from this reminder</td>
</tr>
</tbody>
</table>
### Abbrev | Action Name | Description
--- | --- | ---
| | | dialog. Allows the sequence numbers to be changed. Also enable/disable dialog.
| INQ | Inquiry/Print (for Reminder Dialogs only) | Print details of this reminder dialog.

### Dialog Edit Options

The edit options allow changes to the selected reminder dialog. When making changes to dialog elements and prompts, it should be remembered that dialog elements and prompts might be used in more than one reminder dialog. Changing one reminder dialog may affect others. When editing any of the sub items, a list is presented that displays any other dialogs, groups, or elements that are using the item that is being edited. Additional prompts, forced values, dialog elements, and dialog groups may be edited or printed.
Dialog Overview

The action Dialog Overview (DO) allows you to see just the top level of the dialog elements, without the nested items, if the dialog has groups containing elements.

Result Dialogs

Result dialogs contain progress note text that is added to a progress note, based on the results of dialog processing. NOTE: Only Mental Health Instrument results can be used.

Some reminder definitions have Finding Items for MH Instruments. When dialog entries are generated for these reminders, a dialog element will be created for each MH Instrument finding. If a site doesn’t want to see mental health instrument questions and answers added into the progress note, they can control whether to include the questions and answers by answering Yes to the EXCLUDE MH TEST FROM PN TEXT field in the dialog element. If a site wants the mental health instrument questions and answers added to the progress note text, the reminder manager must answer No at the EXCLUDE MH TEST FROM THE PN TEXT field.

When the user enters answers to a mental health instrument, the answers are automatically passed to the Mental Health package to calculate a result, which may be referenced as SCORE. For example, CAGE test has a SCORE from 1-4 and GAF has a SCORE from 1-99.
For most Mental Health tests, progress note text can be automatically generated that summarizes or includes the results (SCORE). Default text is distributed in the REMINDER DIALOG file #801.41 for sites to use for each Mental Health instrument processed in the reminder resolution process. This text may be copied and modified to reflect the site’s preferences for text. The default text is defined in Mental Health Result Dialog Elements. The reminder manager must add the Result Dialog Group to the MH Instruments Dialog Element RESULT GROUP SEQUENCE field. This result dialog may define further processing to conditionally generate progress note text based on the SCORE.

The Result Dialog Elements provide a number of fields for flexible use of progress note text.

RESULT CONDITION: Enter M code which, when evaluated to 1, would generate the progress note text and create finding entries defined in the RESULT DIALOG ELEMENT. Currently, The logic can only use the value stored in an M local variable called SCORE.

PROGRESS NOTE TEXT: Enter the word processing text to add to the progress note. Use a blank space in the first character of a line when you want the line to be printed as it appears in the text. The "|" (vertical bar) may be used around the M variable SCORE to include the score within the text (MH Tests only). Response values may be included in the text for the AIMS test only, and limited to the variables specified in the default AIMS text.

Example of one of the CAGE Result Dialog Elements distributed with the package:

NAME: CAGE RESULT ELEMENT 1  Replace <Enter>
RESULT CONDITION: I SCORE<2/> <Enter>
PROGRESS NOTE TEXT: <Enter>
An alcohol screening test (CAGE) was negative (score=|SCORE|).
Mental Health Result Dialogs

Dialogs for mental health tests can be set up in Clinical Reminders. A reminder definition can include any mental health instrument.

Changes to be made by CPRS 29
CPRS will use the MH dlls exclusively to evaluate reminders and not rely on the older mental health reminder dialogs when the MH dlls are not installed on the client machine. This change will be part of CPRS v29.

This change will affect the warning message presented to the user along with one parameter and one RPC. The parameter and RPC will no longer be used and therefore will be removed from the system upon install of v29. The parameter is OR USE MH DLL. The RPC is ORQQPXRMMHDDLDM.

With CPRS 27 and MH DLL:

![Mental Health Result Dialogs]

**IMPORTANT NOTE:**
Mental Health patches YS*5.01*103 and YS*5.01*105 included a number of new instruments. Of these new instruments, the following utilize complex scoring algorithms.
24 MHA tests with complex scoring or reporting with the release of patches: YS*5.01*103 and YS*5.01*105:

<table>
<thead>
<tr>
<th>AUDC</th>
<th>BAI</th>
<th>BAM</th>
<th>BAM-C</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAI</td>
<td>BASIS-24</td>
<td>BDI2</td>
<td>BHS</td>

<td>POQ</td>
<td>QOLI</td>
<td>SBR</td>
</tr>
<tr>
<td>STMS</td>
<td>VR-12</td>
<td>WHODAS 2</td>
<td>WHYMPI</td>
</tr>
</tbody>
</table>

Eighteen of these do not score accurately in Clinical Reminders and Health Summary.

18 MHA tests not scoring accurately in Clinical Reminders and Health Summary packages

- (BAI) Beck Anxiety Inventory
- (BAM-C) Brief Addiction Monitor Consumption
- (BAM-R) Brief Addiction Monitor Revised
- (BASIS-24) Behavior And Symptom Identification Scale-24
- (BHS) Beck Hopelessness Scale
- (BSI) Beck Scale for Suicide Ideation
- (CDR) Clinical Dementia Rating
- (FAST) Functional Assessment Stage Test
- (ISMI) Internalized Stigma of Mental Illness
- MINICOG
- (MMPI-2-RF) Minnesota Multiphasic Personality Inventory – Restructured Form
- (NEO-PI-3) NEO-Personality Inventory
- (POQ) Pain Outcomes Questionnaire
- (QOLI) Quality of Life Index
- (STMS) Short Test of Mental Status
- (VR-12) Veterans Rand 12 Item Mental Health Survey
- (WHODAS 2) World Health Organization Disability Assessment Schedule
- (WHYMPI) West Haven-Yale Multidimensional Pain Inventory

PROBLEMS WITH REMINDER DIALOOGS
If you administer any of these 18 instruments within a Reminder Dialog template, the score that is displayed in the Progress Note will be incorrect. However, the correct score is displayed when reviewing the results in MHA3.

PROBLEMS WITH MH SCORE HEALTH SUMMARY COMPONENT
The scores of these instruments will not display correctly using the MH SCORE Health Summary component, regardless of the tool used to administer the instrument (Reminder Dialog template OR
If you review the scores under the Reports Tab, via an ADHOC Health Summary using the MH SCORE item, the scores displayed are incorrect. Any Health Summary Patient Data objects that have been created, using the MH SCORE health summary element with these instruments will display incorrect scores as well in note templates using the Patient Data object.

**PROBLEMS WITH REMINDER DEFINITIONS**

Any reminder definitions for Coversheet reminders or reports using the above instruments as finding items would display incorrect scores in the Clinical Maintenance output. Any Conditions using the scores of these instruments would evaluate incorrectly.

It is strongly suggested that sites NOT use the above instruments within a Reminder Dialog template for administration and NOT use them in any Health Summary. They should NOT be used in a Reminder Definition for any purpose other than verifying that the instrument was administered. In other words, there should be no use of the score.

**Reminder Dialog Branching Logic**

This functionality allows the Clinical Reminder Manager to setup Reminder Dialogs to change the layout in CPRS based on patient data that is stored in VistA. With PXRM*2.0*45, the Clinical Reminder Manager can setup multiple branching logic statements with a sequence number. The branching logic statements are evaluated in order by sequence number and the first true branching logic statement action will be applied to the Reminder Dialog layout in CPRS. With the new Branching Logic Functionality, if the statement is replacing the existing element/groups and if the new element/group contains branching logic, those branching logic statements will now be evaluated, before PXRM*2.0*45, this did not happen.

Examples of Branching Logic statements:

- Replaced by VA-WH SMART BR MALE PROCEDURE DOCUMENT if Reminder Term VA-PATIENT IS MALE evaluates as True
- Replaced by VA-WH GP BR REVIEW ALERT OVERALL if Reminder Definition VA-WH BL BR ALERT WITH NO OPEN PROCEDURE evaluates as Due
- Hide if Reminder Term VA-WH BL BREAST CASCADE EXIST evaluates as False

**Branching Logic Sequence:** This field accepts a number and is used to determine the order to evaluate the patient data. The first patient data that evaluates true for the Branching Logic statement will take effect in CPRS. This Sequence is very important when adding multiple Branching Logic statements to a Reminder Dialog Element/Group.

**Evaluation Item:** This is either a Reminder Term or a Reminder Definition to use in the Branching Logic Statement to evaluate the patient data on the system.

**Evaluation Status:** This field is used in the Branching Logic statement to determine if the statement is true based on the results of the Reminder Term/Definition defined in the Evaluation Item Field. The possible values are different depending on the type of item selected in the Evaluation Item field.

- Evaluation Item is a Reminder Term
  - True
  - False
Evaluation Item is a Reminder Definition
- Due
- Applicable
- N/A

Action: Is the type of action that should happen in CPRS if the Branching Logic statement is true.
Reminder Dialog Element/Groups support the following actions:
- Hide
- Replace
- Check Checkbox
- Suppress Checkbox and Show

The following Actions are only selectable when the item containing the branching logic is a group. These actions will change the Multiple Selection value of the group if the Branching Logic statement is true.
- No Selection Required
- One Selection Only
- One or More Selections
- None or One Selection
- All Selections are Required

NOTE: When using a Reminder Definition as an Evaluation Item, the Evaluation Status of DUE is a subset of the Applicable status. If performing multiple Branching Logic statements against a Reminder, the evaluation is looking for both a Due Status or Applicable. Make sure the DUE status branching statement Branching Logic Sequence value is before the Applicable status Branching Logic Sequence value.

**Editing Template Fields used in Reminder Dialogs**

How to set the TIU parameter that allows a user access to the Options/Edit Template Fields from the CPRS GUI Notes tab:

The Edit Template Fields option can be used to create sets of checkboxes, radio buttons, etc., which can be used in reminder dialogs.
In order to use the Edit Template Fields option to edit template fields used in Reminder Dialogs, the following are required:

1. New option: TIU Template Reminder Dialog Parameter, on the CPRS Parameter menu on the Reminder Manager Menu
2. TIU parameter TIU FIELD EDITOR CLASSES
3. User Class of Clinical Coordinator

**TIU parameter TIU FIELD EDITOR CLASSES**

Select OPTION NAME: `xpar edit`

OR     Reminder Dialog Elements Orphan Report
ER     Empty Reminder Dialog Report
CH     Check Reminder Dialog for invalid items

Select Dialog Reports Option:

Check Reminder Dialog for Invalid Items

This option scans the selected dialog items for invalid sub-items, findings, TIU Objects, and/or TIU Templates. If any invalid items are found in the dialog, the results will be displayed to the user. This option allows for any dialog items to be selected, except for Additional Prompts and Forced Values.

The dialog checker report will check for the following items.

1. Disabled dialog items in the selected dialog
2. Incomplete sequences in the selected dialog
3. All sub-items in the selected dialog are pointing to valid entry on the system
4. All finding items, additional finding items, and orderable items are pointing to a valid entry on the system
5. Result groups are pointing to a valid MH Test and an MH scale has been defined for the result group
6. An odd number of "|" characters in a dialog text field. If this is the case, it would not be possible to determine which part is a TIU Object
7. Progress Note Text and the Alternate Progress Note text fields have valid TIU Objects and TIU Template Field
8. Dialogs that have recursion errors
9. Incomplete Branching Logic Statements
10. Review the Reminder Definition and Reminder Terms used in Branching Logic for errors
Example of output

Select Reminder Dialog Management <TEST ACCOUNT> Option: DR Dialog Reports

OR    Reminder Dialog Elements Orphan Report
ER    Empty Reminder Dialog Report
ALL   Check all active reminder dialog for invalid items
CH    Check Reminder Dialog for invalid items

Select Dialog Reports Option: CH Check Reminder Dialog for invalid items
Select Dialog Definition: EXCHANGE DIALOG reminder dialog LOCAL
...OK? Yes// (Yes)

EXCHANGE DIALOG contains the following errors.
The dialog element INACTIVE OBJECT contains a reference to a TIU Object NP TIUHS OBJECT TEST in the Dialog Text field. This TIU Object is inactive.

Check All Reminder Dialogs for Invalid Items

Select Dialog Reports Option: ALL Check all active reminder dialog for invalid items

COPY OF AGE TEST contains the following errors.
The dialog group HF BINGE DRINKING OTHER is disabled.

AGP INDENT TEST contains the following errors.
The dialog element 123456789 123456789 123456789 123456789 123456789 123456789 123456789 contains a pointer to an additional finding item that does not exist on the system.

ZZPJH REMINDER contains the following errors.
The dialog element WH PAP, ANNUAL DUE. contains an a pointer to the finding item that does not exist on the system.

PHARMACY DISCHARGE MEDICATIONS contains the following errors.
The dialog element PHARMACY DISCHARGE MEDS QUESTIONS contains a reference to a TIU Object OUTPATIENT MEDS in the Dialog Text field. This TIU Object does not exist on the system.

The dialog group GRP MOVE! SCREENING 5/2007 contains a reference to a TIU Object BMI (BODY MASS INDEX %) in the Dialog Text field. This TIU Object does not exist on the system.

Pap Smear (local) contains the following errors.
The dialog element EX PAP DONE contains a reference to a TIU Object PAP SMEAR in the Dialog Text field. This TIU Object does not exist on the system.

ETC.

**DONE**
Dialog Taxonomy Changes

**Before PXRM*2*26**, users created Reminder Dialogs by adding individual ICD-9-CM and/or CPT-4 codes. When using codes as Finding Items or Additional Finding Items in CPRS, the end user didn’t select codes; codes were automatically filed to VistA when the element/group was selected in the Reminder Dialog. If the Reminder Dialog was set up to use a Taxonomy, it could only be used as a Finding Item; it created a pick list of codes for the user to pick from in CPRS.

The display in CPRS was controlled by the set-up in the Reminder Finding Parameter File (#801.45) and the Reminder Taxonomy File (#811.2). These controls determined if the Taxonomy should assign codes to the current encounter or an historical encounter and what prompts should be assigned to the Reminder Dialog in CPRS.

**After PXRM*2*26**, users will no longer be able to add ICD-9-CM and/or CPT-4 codes to a Reminder Dialog. Users will need to create a Taxonomy, assign codes, and then add the Taxonomy to the Reminder Dialog. To maintain similar end user functionality in CPRS, a new field called Taxonomy Pick List Display has been added to the dialog editor. This controls how Taxonomies should display in CPRS.

Dialog Taxonomy Editor

A simple taxonomy editor that is accessed from the Dialog Management menu (either the element or group view) is available. Codes added in this editor are automatically marked as Use In Dialog (UID). If the code already exists in the Selected Codes multiple, all instances of it are marked as UID. If the code does not already exist, it is added to the Selected Codes multiple with TERM/CODE set to the code and the code is marked as UID. If a code is deleted in this editor, UID is removed from all instances of the code but it is not deleted from the Selected Codes multiple. You must use the regular taxonomy editor to actually delete the code.

CHOOSE 1-5: 2 10 EG ICD10 AND CPT LOCAL
New Fields

**Taxonomy Pick List Display** - This field controls if and what pick lists should appear in CPRS. The possible values for the option are based on the setup of the Taxonomy in the Finding Item Field. If a pick list is set to not display, then the active codes marked to be used in a dialog will automatically be filed to PCE for the encounter date for that element when the finish button is clicked. Possible values for this field:

- **All** = A pick list will display for each code type (ICD/10D and CPT) in taxonomy.
- **Diagnosis Only** = A pick list will display only for ICD/10D codes
- **Procedure Only** = A pick list will display only for CPT codes
- **None** = Will not display a pick list

**Diagnosis Header** - This field displays text that will be used for the Taxonomy Checkbox. The prompt is only available if the Taxonomy Selection Value is set to All. The default value is from the Reminder Finding Type Parameter.
Procedure Header - This field displays text that will be used for the Taxonomy Checkbox. The prompt is only available if the Taxonomy Selection Value is set to All. The default value is from the Reminder Finding Type Parameter.

Also, after PXRM*2.0*26 is installed, users will no longer be able to set one Taxonomy Element to prompt for both Current and Historical Encounter Data. Users will need to create an element for each encounter type, Current and Historical. If the element Resolution Type is set to Done Elsewhere, then the editor will prompt the user to accept the default prompts for the taxonomy which includes prompts for historical data. Any other resolution type or no resolution type will prompt data for the current encounter date.

For the ICD-10 implementation, Reminder Dialogs will display ICD-9-CM or ICD-10-CM in a pick list based on the code set versioning rules. Reminder Dialogs determine what codes to display using the following rules:

- Current encounters= active codes for that encounter date; Addendums will use the parent note Encounter date.
- Historical encounters= active codes for system date

Examples:

An example Taxonomy that is a copy of VA-ADB AORTIC; this example has additional codes set to be used in a dialog.

REMINDER TERM:
Input your edit comments.
Edit? NO//

With this setting, all active diagnosis/procedure codes marked to be used in a dialog will automatically be filed to the current encounter.
Note: In the first example the software added the following prompts to the dialog element.

Prompt: PXRM COMMENT
Prompt: PXRM VISIT DATE
Prompt: PXRM OUTSIDE LOCATION
Prompt: PXRM PRIMARY DIAGNOSIS
Prompt: PXRM QUANTITY
Prompt: PXRM ADD TO PROBLEM LIST

In examples 2-5, the prompts were not changed. CPRS will determine which prompts to show, based on the prompts assigned to the element, the codes in the taxonomy, and the Resolution Status Field. However, it is good practice to remove prompts that are not being used by the dialog.

**Taxonomy Editor**

A simple taxonomy editor that is accessed from dialog management (either the element or group view) is also available. Codes added in this editor are automatically marked as Use In Dialog. If a code is deleted in this editor, the Use In Dialog designation is removed from the code.

**Add/Edit Reminder Categories**

Reminder categories are maintained with this option. A category defines a group of reminders and may include other sub-categories.

To activate categories so that they appear in the reminders window in CPRS (under Other Categories), use the option CPRS Lookup Categories on page 311.

The first screen in this option displays the existing reminder categories:

```

New Reminder Parameters - Edit Cover Sheet Reminder List

This option lets you set the parameter ORQQPX NEW REMINDER PARAMS for editing cover sheet reminders. If this option is set to YES, you won’t use the option CPRS Cover Sheet Reminder List.
New Reminder Parameters Example

Select CPRS Reminder Configuration Option: NP New Reminder Parameters

Use New Reminder Parameters may be set for the following:
1. User USR [choose from NEW PERSON]
2. Service SRV [choose from SERVICE/SECTION]
3. Division DIV [choose from INSTITUTION]
4. System SYS [Example.notURL.VA.GOV]
5. Package PKG [ORDER ENTRY/RESULTS REPORTING]

Enter selection: 1 User NEW PERSON
Select NEW PERSON NAME: CRPROVIDER,ONE OC

--------- Setting Use New Reminder Parameters for User: CRPROVIDER,ONE ---------
USE NEW REMINDER PARAMS: YES

There are two possible cover sheet lists for a user, one when ORQQPX NEW REMINDER PARAMS is “NO” and one when it is “YES.” Determining the value of ORQQPX NEW REMINDER PARAMS for a user is not always a straightforward exercise. For a basic understanding of how parameters work in CPRS, see the CPRS Technical Manual or Kernel Toolkit documentation.

The precedence for ORQQPX NEW REMINDER PARAMS is shown in the above example.
- If it is defined at the User level, then that takes precedence.
- If it is not defined at the User level, then a check is made at the Service level.
- If it is not defined at the Service level, then a check is made at the Division level, and so on until a value is determined.
- If the checking proceeds all the way to the Package level and nothing is defined at that level, then it defaults to “NO.”

There are two kinds of users with respect to the management of cover sheet lists.
- Regular users
- Reminder managers

A reminder manager is anyone who has PXRM MANAGERS MENU as a primary or secondary menu option. A regular user can only edit their own cover sheet list, while a reminder manager can edit and manage cover sheet lists at all levels.

We recommend that ORQQPX NEW REMINDER PARAMS be set to “YES” for all users, because of the enhanced functionality that it makes available.

It is possible that a site may choose to use the old cover sheet list functionality, so we will start with a discussion of how things work when ORQQPX NEW REMINDER PARAMS is “NO.”

If your site is using the new cover sheet list functionality, then you can skip the following section.
**ORQQPX NEW REMINDER PARAM set to “NO”**

A regular user accesses the editing form by clicking on Options under the tools menu.

Then click on Clinical Reminders to get to the editing form.
Highlight an item in the **Reminders not being displayed** field and then click the Add arrow “>” to add it to the **Reminders being displayed** field. You may hold down the Control key and select more than one reminder at a time. When you have all of the desired reminders in the **Reminders being displayed** field, you may highlight a reminder and use the up and down buttons on the right side of the dialog to change the order in which the reminders will be displayed on the Cover Sheet.

**Sort by**
Select Display Order to display the reminders in the order that you choose. Click Alphabetical to have the reminders displayed in alphabetic order.

This list is the list defined at the user level and takes precedence over any lists defined at higher levels, i.e. Location, Service, Division, System, or Package. A regular user cannot edit the list at any of these higher levels. A reminder manager can edit the list at these higher levels through the CPRS Cover Sheet Reminder List (CS) option described above (page 312).

**ORQQPX NEW REMINDER PARAM set to “YES”**

The new type of cover sheet list provides a great deal of flexibility, allowing the reminder manager to build lists at the User, User Class, Location, Service, Division, and System levels. Note that these levels are not exactly the same as with the old type of list, where they were User, Location, Service, Division, and Package.

An important distinction between the new type of list and the old type is the new list is cumulative and removable. For example, if a list is defined at the system level, reminders can be added to or removed from the list at the User level. There may be certain reminders that should be on all users’ coversheet lists and these can be locked by the reminder manager.

The reminder manager accesses this functionality by clicking on the reminder button next to the CWAD button in the upper right hand corner of the CPRS GUI.

Click on Action then click on Edit Cover Sheet Reminder List.
This reminder manager form provides very extensive cover sheet list management capabilities. It consists mainly of three large list areas.

- **Cover Sheet Reminders (Cumulative List)** displays selected information on the Reminders that will be displayed on the Cover Sheet.
- **Available Reminders & Categories** lists all available Reminders and serves as a selection list.
- **User Level Reminders** displays the Reminders that have been added to or removed from the cumulative list.

You may sort the Reminders in **Cover Sheet Reminders (Cumulative List)** by clicking on any of the column headers. Click on the Seq (Sequence) column header to view the Reminders in the order in which they will be displayed on your cover sheet.

**Icon Legend**

An icon legend is displayed to the right of **Cover Sheet Reminders (Cumulative List)**.

- Folder icon represents a group of reminders
- Red alarm clock represents an individual reminder.
- Plus sign in the first column means a reminder has been added to the list
- Minus sign in the first column means a reminder has been removed from the list
- Padlock icon means you can’t remove reminder (mandatory)
Cover Sheet Reminders (Cumulative List)

The Level column of the Cover Sheet Reminders (Cumulative List) field displays the originating authority of the Reminder, which can include System, Division, Location, User Class, and User. Reminders on this list that display a small gray padlock icon at the beginning of the line cannot be removed. These Reminders are mandatory. The Seq (Sequence) column defines the order in which the Reminders will be displayed on the Cover Sheet. If there are two or more Reminders with the same sequence number, the Reminders are listed by level (System, Division, Service, Location, User class, User).

Available Reminders & Categories

This area displays all of the Reminders and Categories available to the user. Categories are groups of related reminders that can be added as a group. Individual reminders within a category can be removed from the User Level Reminders field. Highlight a Reminder or Category from the field and click the right arrow to add them to the User Level Reminders field.

Select Cover Sheet Parameter Level to Display / Edit

This section has radio buttons for System, Division, Service, Location, User Class, and User. When one of the radio buttons is clicked, the list of reminders included at that parameter level appears in the box on the lower right-hand side of the form. You can then perform any of the following editing actions:

- To add a reminder, highlight the desired reminder in the Available Reminders & Categories field and click the right arrow button.
- To delete a reminder, highlight the reminder and click the left arrow.
- To make a reminder mandatory, select a reminder and then click on the Lock button.
- To make a mandatory reminder no longer mandatory, click on either the Add or Remove buttons, depending on if you want it to remain on the list or be removed.
- To determine the order in which the reminders will be displayed on the Cover Sheet, change the reminder’s Sequence number. To do this click on the reminder and then change its sequence number in the sequence number box.

View Cover Sheet Reminders

Since the cover sheet list is cumulative and removable, it is not always easy to determine exactly which reminders will be on a user’s cover sheet list. Clicking on the View Cover Sheet Reminders button will display the final list for the user that has been selected at the User parameter level.
User level Cover Sheet Reminder Screen

A user level editing form is also available by clicking on the Tools menu, then options, then Clinical Reminders. This is the same sequence as shown in the previous section for getting to the user editing form.

This form lets the user add or remove reminders (with the exception of locked reminders) to their cover sheet list. The functionality is basically the same as that described above.

Setting User and System Levels

The following Forum dialog might clarify some issues about setting levels:

Subj: CPRS COVERSHEET REMINDERS SETUP THRU GUI

We are having some problems with appropriate clinical reminders showing on coversheet when set up at SYSTEM or SERVICE level in GUI. Reminders set for SYSTEM are also showing for a user in a service that is also set up (EX: Medical). In other words, all of the reminders set for Medical Service show on coversheet as well as those set under SYSTEM. When I completely remove the GUI setup for SYSTEM, users no longer have those clinical reminders show on coversheet. I need the SYSTEM setting for those not set up in a service.

Per NOIS CAH-1003-31162, site had a similar problem and resolution stated there was a specific hierarchy (that seems to be different from others). I thought that if there was something set at USER level, that would take precedence over SERVICE or SYSTEM, but that doesn't seem to be true in this case.
MY QUESTION IS THIS: Can someone explain what the hierarchy is when setting clinical reminders in GUI vs VISTA. Should we only have setup in one or the other? I cannot find anything on this in documentation.

1. The hierarchy for reminders displaying on the GUI cover sheet is cumulative, so there is really no hierarchy, only the ability to add to the list at different levels. System displays to all users, division adds to system for users in that division, service adds to division and/or system for users in that service, etc.
   There used to be a hierarchy but that changed some time ago.
2. Check out HUN-0701-20018  RESTRICTED REMINDERS
   You can have it both ways - Cumulative and Restricted.
3. You just have to remember you have two different set-ups if you add or subtract reminders.
4. You have to have the parameter for using the new reminder parameters set to yes to take advantage of this:

   Select CPRS Reminder Configuration Option: NP  New Reminder Parameters

   Use New Reminder Parameters may be set for the following:

   1  User          USR    [choose from NEW PERSON]
   2  Service       SRV    [choose from SERVICE/SECTION]
   3  Division      DIV    [choose from INSTITUTION]
   4  System        SYS    [Example.notURL.VA.GOV]

   Enter selection: 4  System    [Example.notURL.VA.GOV]

   -- Setting Use New Reminder Parameters  for System: Example.notURL.VA.GOV ----
   USE NEW REMINDER PARAMS: YES//
   HUN-0701-20018  RESTRICTED REMINDERS
   Description:

   Q  Our mental health providers should only see certain reminders due on a patient. I have them set under service to see:

   Setting ORQQPX COVER SHEET REMINDERS  for Service: MENTAL HEALTH ------

   Select Display Sequence: ?

   Display Sequence Value
   --------------- ----- 
   10             LR1006
   20             LR581016
   30             LR581011
   40             LR581002
   50             LR581007
They are seeing all reminders set at SYSTEM level + the additional reminders. Is something set up wrong or is this now cumulative? Is there a way so that they will only see the reminders relative to their service?

(12) Jul 05, 2001@09:43:26 CRSUPPORT,ONE
Well, we took a look at the parameters and the following...
Select CPRS Reminder Configuration Option: np New Reminder Parameters
Use New Reminder Parameters may be set for the following:

1  User    USR    [choose from NEW PERSON]
2  Service SRV    [choose from SERVICE/SECTION]
3  Division DIV    [VAMC TWO PIA]
4  System  SYS    [EXAMPLE.NOTURL.VA.GOV]
5  Package PKG    [ORDER ENTRY/RESULTS REPORTING]

Enter selection: 4 System EXAMPLE.NOTURL.VA.GOV
-- Setting Use New Reminder Parameters for System: EXAMPLE.NOTURL.VA.GOV ---
USE NEW REMINDER PARAMS: NO/

These can be set to YES or NO at any of the levels. I suggested they set the Mental Health and Optometry service to NO. Hopefully, now they will only see their DUE reminders and not everyone else’s.
The other alternative is to set the ORQQPX REMINDER FOLDERS to Other Categories for these services. Then within the Other Categories, set up specific category names for the service’s specific reminders. This would group the reminders together.
Mental Health Dialogs Active

This option lets you modify the “Mental Health Active” CPRS parameter. You can activate mental health dialogs for reminder resolution processing at a user, service, division, or system level. When activated, mental health tests in a reminder dialog can be performed.

Select CPRS Reminder Configuration Option: MH  Mental Health Dialogs Active
Mental Health Active may be set for the following:

1  User          USR     [choose from NEW PERSON]
2  Service       SRV     [choose from SERVICE/SECTION]
3  Division      DIV     [choose from INSTITUTION]
4  System        SYS     EXAMPLE.NOTURL.VA.GOV

Enter selection: 1  User   NEW PERSON
Select NEW PERSON NAME: CRPROVIDER,SIX     sc

---------- Setting Mental Health Active for User: CRPROVIDER,SIX ---------
MENTAL HEALTH ACTIVE: YES// <Enter>

CA     Add/Edit Reminder Categories
CL     CPRS Lookup Categories
CS     CPRS Cover Sheet Reminder List
MH     Mental Health Dialogs Active
PN     Progress Note Headers
RA     Reminder GUI Resolution Active
DL     Default Outside Location
PT     Position Reminder Text at Cursor
NP     New Reminder Parameters

Select CPRS Reminder Configuration Option: <Enter>
Progress Note Headers

This option lets you modify the header inserted into the progress note when processing a reminder. It can be modified for user, location, or service. The default header is Clinical Reminders Activity.

Select CPRS Reminder Configuration Menus Option: PN Progress Note Headers
Progress Note Header may be set for the following:

1. User USR [choose from NEW PERSON]
2. Location LOC [choose from HOSPITAL LOCATION]
3. Service SRV [choose from SERVICE/SECTION]
4. Division DIV [REGION 5]
5. System SYS [EXAMPLE.NOTURL.VA.GOV]
6. Package PKG [CLINICAL REMINDERS]

Enter selection: 1 User NEW PERSON
Select NEW PERSON NAME: CRPROVIDER,ONE jg

------------ Setting Progress Note Header for User: CRPROVIDER,ONE ---------
PROGRESS NOTE HEADER: ?

This response can be free text.
PROGRESS NOTE HEADER: GREEN NOTES

Progress Note Header text appears at the top of all text generated from reminder dialogs for a given note.
Reminder GUI Resolution Active

This option lets you activate GUI reminder resolution processing at a user, service, division, or system level. When activated, a reminders drawer is available on the notes tab for selecting and processing reminders.

Select CPRS Reminder Configuration Menus Option: RA Reminder GUI Resolution Active

Reminders Active may be set for the following:

1. User USR [choose from NEW PERSON]
2. Service SRV [choose from SERVICE/SECTION]
3. Division DIV [choose from INSTITUTION]
4. System SYS [EXAMPLE.NOTURL.VA.GOV]

Enter selection: 1 User NEW PERSON
Select NEW PERSON NAME: CRPROVIDER,ONE jg

--------------- Setting Reminders Active for User: CRPROVIDER,ONE ---------------
REMINDERS ACTIVE: YES// <Enter>

Default Outside Location

Within portions of a reminder dialog where historical encounter information is entered, a new parameter, ORQQPX DEFAULT LOCATIONS, can be set up to define default outside locations for the PXRM OUTSIDE LOCATION prompt. Each free-text entry in this multi-valued parameter will appear at the top of the list of locations in the drop-down list in CPRS. If a number is entered as the free-text value, CPRS will attempt to locate an entry in the Institution file (#4) with the same internal entry number.

Example

Select CPRS Reminder Configuration Option: dl Default Outside Location

Default Outside Locations may be set for the following:

1. User USR [choose from NEW PERSON]
2. Service SRV [choose from SERVICE/SECTION]
3. Division DIV [choose from INSTITUTION]
4. System SYS [EXAMPLE.NOTURL.VA.GOV]
5. Package PKG [ORDER ENTRY/RESULTS REPORTING]

Enter selection: 1 User NEW PERSON
Select NEW PERSON NAME: CRPROVIDER,TWO TC

---------- Setting Default Outside Locations for User: CRPROVIDER,TWO ----------
Select Display Sequence: 1

Display Sequence: 1// 1
Outside Location (Text or Pointer): 663
Select Display Sequence: 2
Are you adding 2 as a new Display Sequence? Yes// <Enter> YES

Display Sequence: 2// <Enter>
Outside Location (Text or Pointer): Local Pharmacy

Select Display Sequence: 3
Are you adding 3 as a new Display Sequence? Yes// <Enter> YES
Display Sequence: 3// <Enter> 3
Outside Location (Text or Pointer): 640

Select Display Sequence: 4
Are you adding 4 as a new Display Sequence? Yes/ <Enter> YES
Display Sequence: 4/ <Enter> 4
Outside Location (Text or Pointer): Outside Physician's Office
Select Display Sequence: ???

<table>
<thead>
<tr>
<th>Display Sequence</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>663</td>
</tr>
<tr>
<td>2</td>
<td>Local Pharmacy</td>
</tr>
<tr>
<td>3</td>
<td>640</td>
</tr>
<tr>
<td>4</td>
<td>Outside Physician's Office</td>
</tr>
</tbody>
</table>

Default Location as it appears in CPRS:

- Seattle, WA
- Local Pharmacy
- Palo Alto
- Outside Physician's Office
- Albany, NY

Note that Seattle, WA and Palo Alto are entries in the institution file with internal entry numbers of 663 and 640, respectively.

**Position Reminder Text at Cursor**

The default behavior of reminder dialogs is to insert any text generated by the reminder dialog at the bottom of the current note. When the ORQQPX REMINDER TEXT AT CURSOR parameter is set, text will be inserted at the current cursor location.

Select CPRS Reminder Configuration Option: PT Position Reminder Text at Cursor

Position Reminder Text at Cursor may be set for the following:

- 1 User USR [choose from NEW PERSON]
- 3 Service SRV [choose from SERVICE/SECTION]
- 4 Division DIV [choose from INSTITUTION]
- 5 System SYS [EXAMPLE.NOTURL.VA.GOV]

Enter selection: 1 User NEW PERSON
Select NEW PERSON NAME: <Enter> CRPROVIDER,ONE OC

------ Setting Position Reminder Text at Cursor for User: CRPROVIDER,ONE ------
REMINDER TEXT AT CURSOR: ?

Insert Reminder Dialog Generated Text at Cursor Location.

Select one of the following:

- 0 NO
- 1 YES

REMINDER TEXT AT CURSOR: YES
TIU Template Reminder Dialog Parameter

This option lets users edit the TIU TEMPLATE REMINDER DIALOG parameter.

| Select CPRS Reminder Configuration Option: tiu TIU Template Reminder Dialog Parameter |
| Reminder Dialogs allowed as Templates may be set for the following: |
| 1 User USR [choose from NEW PERSON] |
| 3 Service SRV [choose from SERVICE/SECTION] |
| 4 Division DIV [choose from INSTITUTION] |
| 5 System SYS [EXAMPLE.NOTURL.VA.GOV] |

Enter selection: 1 User NEW PERSON
Select NEW PERSON NAME: CRPROVIDER, TWO tc

---- Setting Reminder Dialogs allowed as Templates for User: CRCOORDINATOR, ONE ----
Select Display Sequence: ??

Contains Reminder Dialogs that are allowed to be used as TIU Templates.
This parameter is different than most others in that each level is cumulative, so all Reminder Dialogs at the System, Division, Service and User levels can be used in Templates.

Select Display Sequence: 1
Are you adding 1 as a new Display Sequence? Yes// YES

Display Sequence: 1/ 1
Clinical Reminder Dialog: JG DIABETIC EYE EXAM reminder dialog LOCAL
Select Display Sequence:

GEC Status Check Active

A GEC Status Indicator may be added to the CPRS GUI Tools drop-down menu, to be viewed at any time and used to close the referral if needed. It may be set at the User or Team level through this option. See Appendix C for more information about GEC Referral and GEC Reports.

Select CPRS Reminder Configuration Option: GEC GEC Status Check Active

Gec Status Check may be set for the following:

| Enter selection: 1 User NEW PERSON |
| Select NEW PERSON NAME: CRPROVIDER, ONE OC |

------------- Setting Gec Status Check for User: CRPROVIDER, ONE -------------

GEC Status Check: YES// <Enter>

WH Print Now Active

The “Print Now” button on the Women’s Health review reminders is optional. A parameter can be set (at the system level) to allow the “Print Now” button to be added to the dialog. By default, “Print Now” is turned off: the CPRS Reminder Configuration Option called WH Print Now Active is released with a
Value of NO. If the value is changed to YES, the “Print Now” button will appear on the dialog. Whether the “Print Now” button is added to the dialog or not, the default will always be that the letter is queued to the WH package.

The text in the progress note will be one of the following:

Print Now Active/Yes: Letter queued to print at Device Name on finish Date/Time
Print Now Active/No: Letter queued to WH package Date/Time

Select CPRS Reminder Configuration Option: WH WH Print Now Active

WH Print Now Option Active may be set for the following:

1. System SYS [EXAMPLE.NOTURL.VA.GOV]
2. Division DIV [choose from INSTITUTION]
3. Location LOC [choose from HOSPITAL LOCATION]
4. Service SRV [choose from SERVICE/SECTION]
5. Team (OE/RR) OTL [choose from OE/RR LIST]
6. User USR [choose from NEW PERSON]

Enter selection: 6 User NEW PERSON
Select NEW PERSON NAME: CRPROVIDER,ONE OC

--------- Setting WH Print Now Option Active for User: CRPROVIDER,ONE --------
Value: ?

Enter either 'Y' or 'N'.

Reminder Reports

The Reports menu contains Clinical Reminder reports that Clinical Reminders Managers and/or clinicians can use for summary and detailed level information about patients’ due and satisfied reminders. This menu also contains reports that clinical coordinators can use to review extracted data, based on reminder definitions.

The EPI extract finding list and total options are specific to the Hepatitis C Extract project. The extracted data is based on the following reminders: VA-HEP C RISK ASSESSMENT, VA-NATIONAL EPI LAB EXTRACT, and VA-NATIONAL EPI RX EXTRACT.

The Extract QUERI totals option reports reminder and finding totals from extract summaries created by automatic QUERI extract runs.

The GEC Referral Report option is used to generate GEC Reports. Clinical Reminders V.2.0 includes a nationally standardized computer instrument called VA Geriatric Extended Care (GEC), which replaces paper forms for evaluating Veterans for extended care needs.

Changes made by PXRM*2*26

Finding Usage Report
The finding multiple in file #801.41 had the pointer to file #811.2 defined as Taxonomy instead of Reminder Taxonomy. The caused the finding usage report to have selections for Reminder Taxonomy and Taxonomy. It was renamed to Reminder Taxonomy and the problem was eliminated.

The Finding Usage Report did not have the ability to search for reminder definitions and reminder terms that are used in a Reminder List Rule. That ability was added. There was a bug in the Order Check term search that was corrected. Also, the ability to search Order Check rules for definitions was added. Previously, when the report was run, the user had the option to have it delivered as a MailMan message or have it written to the screen. That was changed, so that the user has the option to browse or print it, and then has the option to have it delivered as a MailMan message.

**Multiple Uses for Reminder Reports**

Reminder reports can be used for a variety of purposes:

**Patient care:**
- Future Appointments
- Which patients need an intervention?

**Past Visits**
- Which patients missed an intervention?
- Action Lists

**Inpatients**
- Which patients need an intervention prior to discharge?

**Identify patients for case management**
- Diabetic patients with poor control
- Identify patients with incomplete problem lists
- Patients with (+) Hep C test but no PL entry
- Identify high risk patients; e.g., on warfarin, amiodarone, etc.
- Track annual PPD due (Employee Health)

**Quality Improvement**
- Provide feedback (team/provider)
- Identify *(and share)* best practices
- Identify under-performers *(develop action plan)*
- Track performance
- Implementation of new reminders or new processes
- Identify process issues early (mismatch of workload growth versus staffing)
- Provide data for external review (JCAHO)
Management Tool

- Aggregate reports
- Facility / Service
- Team (primary care team)
- Clinic / Ward
- Provider-specific reports
- Primary Care Provider
- Encounter location
- If one provider per clinic location

Employee Performance & Evaluation

- Re-credentialing data for providers
- Annual Proficiency - Nursing
- Support for Special Advancement
- Support for Bonuses
- Employee Rewards & Recognition

How date range searching works

- Any of the FileMan date formats are acceptable
  - May 14, 2003, T-1Y, T-2M, T-3D
  - Beginning date default is beginning of data
  - Ending date default is today

As noted above, you can use dates like T-3M for the beginning date/time and T for the ending date/time. Since T stands for today, this tells Clinical Reminders to search between today and 3 months ago for results. When you run a reminder report, one of the prompts is for EFFECTIVE DUE DATE, and when a reminder report is run, “today” becomes whatever date is input in response to the EFFECTIVE DUE DATE prompt.

For example, if the beginning date/time was T-3M and the ending date/time was T and the effective due date was April 1, 2004, Clinical Reminders would search for results between January 1, 2004 and April 1, 2004. If you use an actual, as opposed to a symbolic, date/time, then it is never affected by what is input for EFFECTIVE DUE DATE. Each finding in the definition can have different values for beginning date/time and ending date/time, so you can search in different date ranges, as appropriate.

The key thing to remember is that “T” in a symbolic date is set to the value input for EFFECTIVE DUE DATE.
Reminders Due Report option

For a selected reminder, the report lists any reminders that are currently due.

Available report options are:

- Individual Patient
- Reminder Patient List
- Hospital Location (all patients with encounters)
- OE/RR Team (all patients in team)
- PCMM Provider (all practitioner patients)
- PCMM Team (all patients in team)

A SUMMARY report displays totals of how many patients of those selected have reminders due.

Alternatively, a DETAILED report displays patients with reminders due in alphabetical order. The report displays for each patient the date the reminder is due, the date the reminder was last done, and next appointment date. The detailed report can also list all future appointments.

A DETAILED report may be saved as a local patient list.

Extract EPI Totals

Extract EPI Total reports are generated each month by a Lab package LREPI run that processes the following national reminders related to Hepatitis C:

VA-NATIONAL EPI DB UPDATE
VA-NATIONAL EPI LAB EXTRACT
VA-NATIONAL EPI RX EXTRACT.

Select Reminder Reports Option: Extract EPI Totals
START WITH NAME: FIRST// ??

The NAME is the combination of a unique abbreviation for the type of extract. The file contains different extract types:

1) EPI - Hep C Extract

Extracts of this type are prefixed LREPI. The following is an example of EPI lookup information:

160 LREPI 00/05 061500 Jun 15,2000@14:52:36
161 LREPI 00/06 073100 Jul 15,2000@14:55:40
162 LREPI 00/07 081500 Aug 15,2000@15:42:24

The YY/MM represents the ending year and month of the extract date range, and the run date in the format YYYYMMDD. The date and time of the run is an identifier.
2) QUERI (IHD and MH)

Extracts of this type are prefixed VA-IHD or VA-MH. The following is an example of IHD lookup information:

<table>
<thead>
<tr>
<th></th>
<th>VA-IHD QUERI 2000 M2</th>
<th>Nov 27,2002@13:20:26</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>VA-IHD QUERI 2000 M3</td>
<td>Nov 27,2002@13:24:08</td>
</tr>
<tr>
<td>3</td>
<td>VA-IHD QUERI 2000 M4</td>
<td>Nov 27,2002@13:25:13</td>
</tr>
</tbody>
</table>

The year and month of the extract are included in the extract name. The date and time of the run is an identifier.

Extract QUERI Totals

The NAME is the combination of a unique abbreviation for the type of extract (e.g., LREPI), the YY/MM representing the ending year and month of the extract date range, and the run date in the format YYMMDD. The date and time of the run is an identifier. The following is an example of lookup information.

160  LREPI 00/05 061500  Jun 15,2000@14:52:36
161  LREPI 00/06 073100  Jul 15,2000@14:55:40
162  LREPI 00/07 081500  Aug 15,2000@02:44:54
163  LREPI 00/05 082200  Aug 22,2000@02:44:54
164  LREPI 00/08 082500  Aug 25,2000@14:24:59

**Future Appointments**

A new prompt has been added that will only display if Show All future appointment is selected. The prompt is Display Appointment Location. If you answer Y, the clinic name will appear with the future appointment date/time. If you enter N, only the date/time will display.

If the patient is an outpatient, it will sort by next appointment date. If the patient is a currently an inpatient and has an outpatient appointment schedule, it will sort by the Room-Bed location.

When displaying the next appointment, if the patient is an inpatient, the Room-Bed will be displayed followed by (Inp.). Then the next appointment will display under this data. If you select Display All future appointments, the appointment will display under the patient name.

**GEC Referral Report**

GEC Referral Reports display the percentage of patients referred to select GEC programs who meet the eligibility criteria as outlined in the Under Secretary for Health’s Information Letter IL 10-2003-005 and VHA Handbook 1140.2.

VA GEC Reports provide quarterly statistical reports on the following VA-funded programs.
- Homemaker/Home Health Aide, when Funding Source=VA
- Adult Day Health Care, when Funding Source=VA
- VA In-Home Respite, when Funding Source=VA
- Care Coordination, when Funding Source=VA

When sites submit their quarterly reports, the national office will be able to generate a report for the General Accounting Office/Office of Inspector General that demonstrates compliance with the standards for assessing patients prior to placement in VA-funded programs.

These same reports can be used at the local level to evaluate how well a site is performing in meeting compliance standards for placement of patients in VA funded GEC programs.

**Changes in Patch 4**

- An undefined error, <UNDEFINED>CALCMON+12<>PXRMG2M1, occurred when the scheduled event fired off at the beginning of each month. That has now been repaired.

- Several of the GEC Reports were not showing a complete list of patients or providers. This has now been corrected. The division and age of the patient has been added to some reports to help in identifying the patient.

- There is a new choice in the GEC reports menu that will give the sites the option to open a closed referral, merge two referrals, or close an open referral.

- The GEC Care Recommendation Dialog has been modified to allow more than one selection when a person wants to refer a patient to more than one location.

- A problem with the user being able to take some editing actions on GEC dialogs have been corrected, so the user is not able to copy or delete dialog groups from the GEC dialogs.
• Geriatric Extended Care Reports were not collecting the correct data. This was corrected.

• The email addresses of the remote members of mail group GEC NATIONAL ROLLUP are updated.

• As requested by the primary GEC stakeholder, several reminder dialog entries were moved from the Nursing Assessment GEC dialog to the Care Recommendation GEC dialog. A post-install routine changes several Health Factors from one GEC dialog to another.

Finding Usage Report

This report provides a listing of the reminder definitions, reminder terms, and reminder dialogs in which selected Clinical Reminder findings are used. This can help you troubleshoot when new reminders and dialogs are distributed to replace existing ones.

The report can be sent as a mail message to designated recipients.

Changes made by PXRM*2*26:

- The finding multiple in file #801.41 had the pointer to file #811.2 defined as Taxonomy instead of Reminder Taxonomy. The caused the finding usage report to have selections for Reminder Taxonomy and Taxonomy. It was renamed to Reminder Taxonomy and the problem was eliminated.
- The Finding Usage Report did not have the ability to search for reminder definitions and reminder terms that are used in a Reminder List Rule. That ability was added.
- There was a bug in the Order Check term search that was corrected.
- The ability to search Order Check rules for definitions was added.
- Previously, when the report was run, the user had the option to have it delivered as a MailMan message or have it written to the screen. That was changed, so that the user has the option to browse or print it, and then has the option to have it delivered as a MailMan message.

Select Reminder Reports Option: Finding Usage Report

MST Synchronization Management Project

The Millennium Healthcare and Benefit Act, Public Law 106-117, Section 115, Counseling and Treatment for Veterans Who Have Experienced Sexual Trauma, includes provisions for development of a formal mechanism for reporting on outreach activities and require the Veterans Administration (VA) to provide counseling and appropriate care and services for treatment of Military Sexual Trauma (MST). As a result, the Women Veterans Health Program (WVHP) requested Veterans Health Information System and Technology Architecture (VistA) enhancements to support the screening of all Veterans (men and women) for MST, identification of non-VA workload associated with MST, and enhanced national reporting of MST data. Veterans Health Administration (VHA) Directive 2000-008 and VHA Directive 99-039 provided guidance in the screening, tracking, and documentation of MST in all enrolled Veterans who utilize VHA. Additionally, a “Best Practice” manual provided field guidance on creating local Implementation Support Teams (IST), developing MST screening processes, and documenting screening results using the VistA Military Sexual Trauma database within the Patient Registration Package.

In FY1999, VistA enhancements provided the ability to record or edit Veterans’ MST status in VistA and also created an MST “outpatient classification code” similar to Agent Orange. Once a Veteran has reported MST, the classification code triggers the staff via VistA prompts when they are checking out an encounter to be prompted for whether the encounter is related to MST. VistA began including the MST status and classification code in Patient Care Encounter (PCE) transmissions in May 2000. The Patient Treatment File (PTF) patch was released to sites on March 6, 2001.

MST Scope of Changes

The effort for implementing the MST section of the Millennium Healthcare and Benefits Act (Mill Bill) impacted Fee Basis, Women Health (WH), Health Eligibility Center (HEC/Enrollment), Clinician Desktop, Patient Information Management Systems (PIMS), the Corporate Databases, and VistA software packages.

The enhancements provided a means for identifying non-VA MST workload in the Fee Basis application, clinical reminders to clinicians, and specifications for the VA and non-VA workload reports to be generated at the Austin Automation Center (AAC). Also, PIMS and HEC will manage the MST status sharing between sites to minimize the instances in which a veteran is repeatedly asked about MST status. HEC will act as the authoritative database source.

The data for MST will be entered locally in the VistA system and will be shared with the HEC as part of the current HL7 messaging capabilities. The information entered in the VistA system is sent to the HEC so that it can be transmitted to other VA health care facilities of record. Locally, MST-related, non-VA care will be entered into the Fee Basis system. This information will be sent to Central Fee, where Outpatient non-VA data will be used for national reporting. Inpatient non-VA care is sent to PTF. The system requirements, identified in this document, include additions and modifications to existing field entries on the VistA, HEC, Fee Basis, and Central Fee. There will be no changes to the NPCD or PTF database. NPCD will continue to accept and store MST data.
MST System Features

There are multiple objectives with Mill Bill MST. To determine the amount of care being provided to Veterans who have experienced MST, the Fee Basis system will locally keep track of MST related non-VA care. This information will be sent to Central Fee so that reports reflecting the national experience can be generated. In order to improve data quality, redundant fields in the WVH application and PIMS will be synchronized. Legislation mandates that all Veterans be screened for MST. To reduce the number of times a Veteran would be screened for MST, VAMCs, via PIMS, will provide the HEC with MST status as it is derived. The HEC will be the authoritative database source for MST status and be able to provide other VAMCs with a Veteran’s MST status upon request. **Clinical reminders provides a mechanism to screen Veterans who do not have a MST status for MST and assists with the entry of that information.** VHA wants to have reports from the National Databases (NPCD and Central Fee) that will look at the population and trending of MST across VHA.

**CLINICAL REMINDERS MST FUNCTIONALITY (Patch PXRM*1.5*7)**

This patch, released in January 2002, provided new functionality for Clinical Reminders to help sites meet the mandate to collect Military Sexual Trauma (MST) data. The patch included:

- A new reminder definition, VA-MST SCREENING, and the findings used by the definition. The findings include:
  - Three reminder terms: VA-MST DECLINES REPORT, VA-MST NEGATIVE REPORT, and VA-MST POSITIVE REPORT
  - A computed finding: VA-MST STATUS
  - Four health factors: MST CATEGORY, MST DECLINES TO ANSWER, MST NO DOES NOT REPORT, and MST YES REPORTS
  - A reminder dialog: VA-MST SCREENING.

The reminder dialog has three elements that update PCE with health factor findings (MST NO DOES NOT REPORT, MST YES REPORTS and MST DECLINES TO ANSWER). You will be able to capture data directly to the MST HISTORY file, #29.11, using this reminder dialog.

If your site is already capturing MST data via health factors, education topics, or exams, there is functionality in this patch that will help you synchronize this data with the data in the MST HISTORY file, #29.11. Before the synchronization can be done, you must map your local findings to the appropriate VA-MST reminder term. If you have been using health factors that are similar to those listed above, you may consider renaming your health factors to match the names listed above. The renaming must be done BEFORE the patch is installed or it will not work. If you choose not to do this, or your site has been using education topics or exams, you will need to map your findings to these terms before the initial synchronization can be done.

If your site is already capturing MST data via local health factors, education topics, and exams, the national dialog and component elements and groups may be copied to local dialogs, which may then be modified to use local findings. **The national dialog and component elements and groups may not be edited.** Alternatively, if you already have reminder dialogs for MST, you may continue to use these if the findings in these dialogs are mapped to the new VA-MST terms.
Reminders MST Synchronization Management Menu

This patch also included a new option on the Reminder Managers Menu called Reminders MST Synchronization Management. There are two options on this menu: one for doing the synchronization (Reminders MST Synchronization), and one for checking on the synchronization (Reminders MST Synchronization Report). The first option will allow you to schedule a background job that does the synchronization. The report option will give you data on the initial synchronization and the last daily synchronization.

Last daily synchronization date: Sep 05, 2001@08:45:48
Number of updates made: 0
Elapsed time: 3:57:34
```
Reminder Parameters Menu

This menu contains three options: Edit Site Disclaimer, Edit Web Sites, and Edit Number of MH Questions.

Edit Web Sites was created in response to the NOIS, MAC-1000-60473 - Web site shows in all reminders. Sites were unable to get websites to show for an individual reminder – a default URL and website text overrides individual entries. In Version 1.5, the only way to edit or delete the default website was through VA FileMan. It was recommended that developers create an easier way for a user to edit the default URL Web addresses.

Reminder Patient List Management

New tools for creating and managing reminder patient lists were introduced with Clinical Reminders V2.0. The patient list functionality provides a way to identify patients with specific findings or combinations of findings, without having to search one-by-one through every patient registered on the system.

Patient List summary (from Patty Hoey, Puget Sound HCS)

Clinical Reminder patient lists and extracts represent a watershed advance in VA’s clinical information armamentarium. Before their creation, front-line clinicians wishing to search for clinical data (for evidence-based medicine, process improvements, or clinical research) were limited to VA FileMan. While powerful, FileMan is too esoteric and resource-intensive for many clinicians. Alternatively, several VISNs have data warehouses and allow clinicians to write SQL scripts to search them; but again, the learning curve is steep and the data can be historical and, therefore, not useful for time-sensitive searches.

Because FileMan and SQL are difficult to learn, clinicians are often reliant on technical intermediaries and are subject to their availability. In contrast, the clinical reminder patient list functionality is relatively accessible and comprehensible (with minimal training) to front-line clinicians, allowing any clinician to become an informaticist, avoiding the risk of clinical questions being diluted or lost in translation. With the number of VA clinicians nationwide finally able to access the rich VA database, the potential for advances in patient safety, patient therapy, and processes that realize time and budget savings is boundless. Reminder indexes make the queries fast and consume relatively few computer resources. The searchable database is up-to-date, making patient lists useful for daily patient safety surveillance reporting. Lists can be auto-tasked to run monthly, quarterly, and annually and rolled up into a message for possible transmission to regional patient registries or county health departments.

The patient list functionality was originally created to support reminder extract reports. Reminder extract reports rely on the patient list tools to build patient lists that meet specific finding criteria. The numbers of patients on the patient lists created and used for extract reports are often referred to as patient denominators. The lists of patients are used to evaluate specific reminders to calculate compliance totals and finding totals.

Patient lists can also be created and used independently of extract reporting.

This patient list-building tool uses the Clinical Reminders Index global; consequently, it can build patient lists very quickly. The Clinical Reminders Index provides indexes that support finding all patients with a particular finding (also known as “across-patient look-ups”). The Index global also supports rapidly accessing finding data for a specific patient.

Example: At one site, the Index global was used to build a list of all patients with a diabetic diagnosis in the last five years at a medium-sized site in about two minutes. There were approximately 10,000 patients on the list.

Once a patient list has been created by the reminder patient list tools, it can be stored and used for a number of purposes: reminder extract reports, input to reminder reports, input to health summaries, and creation of mailing lists and personalized form letters.
The reminder patient lists are stored in the Reminder Patient List file (#810.5). The Reminder Patient List Menu (PXRM PATIENT LIST MENU) provides access to the patient list management and list rule management functionality.

List Rules

List rules are the basic building blocks for constructing patient lists. A list rule may be defined using a reminder term, the patient cohort from a reminder definition, or an existing reminder patient list. Before a list rule can be created, the corresponding reminder term, reminder definition, or reminder patient list must already exist. Each list rule is defined independently. Once a list rule is defined, it can be combined with other list rules to build Rule Sets.

There are four types of list rules.

<table>
<thead>
<tr>
<th>Type of List Rule</th>
<th>Abbreviation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Finding Rule</td>
<td>FR</td>
</tr>
<tr>
<td>Reminder Rule</td>
<td>RR</td>
</tr>
<tr>
<td>Patient List Rule</td>
<td>PL</td>
</tr>
<tr>
<td>Rule Set</td>
<td>RS</td>
</tr>
</tbody>
</table>

TIP: These four types of list rules are all stored in the same file, REMINDER LIST RULE (#810.4). A naming convention can be useful for ease of identifying list rule entries by type of list rule. One suggested convention is to use the abbreviations above as a prefix or suffix in the list rule name identifying the type of list rule. We will use this suggested naming convention for the examples of list rules in the List Rule Management Section.

1. Finding rules are used to build lists of patients based on reminder terms. Reminder patient list tools will find patients with the finding(s) defined in the reminder term.

Most of the types of findings that can be defined in the reminder term have a Global Index for across-patient look-ups. However, the Global Index is not used for computed findings linked to a reminder term, unless the computed finding has hard-coded logic to access the Global Index. The typical computed finding assumes the patient is already selected and does not support across-patient look-up. However, with V2.0, a computed finding can be specifically created for list-building purposes by defining the Type field in the computed finding definition as “List.” The List type computed finding can be used as the first rule, or any subsequent rule in a rule set where the ADD PATIENT Operation is used. When a computed finding is used to SELECT or REMOVE patients from an existing patient list, a “single” or “multiple” type computed finding may be used.

2. Reminder rules are used to build lists of patients based on a reminder definition and its patient cohort logic. Before a reminder definition is used to build a patient list, the cohort logic is checked to make sure it meets certain criteria. If it doesn’t, a warning message will be issued. This is done to make sure that building the list is computationally feasible. The criteria for using a reminder definition are:

- The cohort logic cannot start with a logical not
- The cohort logic cannot contain a logical or not
- If AGE is used in the cohort logic, then a baseline age range must be defined
- If SEX is used in the cohort logic the reminder must be sex-specific
- SEX cannot be the first element in the cohort logic unless it is followed by AGE
- If a finding sets the frequency to 0Y, which effectively removes the patient from the cohort, it can’t have an associated age range
- The USAGE field must be specified as “L” for Patient List
3. **Patient List rules** are used to build a new reminder patient list based on the patients in an existing reminder patient list. An existing patient list can be used to create a new list, add patients to a list, remove patients from a list if they are defined in the specified list, and remove patients from a list if they are not defined in the specified list.

4. **List Rule Sets**
A rule set combines list rules and logical operations into a series of steps which are processed to build a patient list. The steps are processed in a numerical order that is based on the value of the SEQUENCE field, which is a three-digit number, i.e., 1 to 999. The first step initializes the list and subsequent steps can add patients (ADD PATIENT) to the list or remove (REMOVE or SELECT) them from it. Since the first step initializes the list, its operation must be ADD PATIENT. Subsequent steps may also use the ADD PATIENT operation to merge patients.

Logical operators (i.e., AND, AND NOT, OR), similar to those used in a reminder definition, are represented by the Rule Set Operations:

**ADD PATIENT** – this works like a Boolean OR; any patient for which the finding is true will be added to the list. This should always be the operation for the first sequence in a rule set. Patient lists may be merged using the ADD PATIENT operation.

**REMOVE** – this works like a Boolean AND NOT; any patient for which the finding is true will be removed from the list.

**SELECT** – this works like a Boolean AND; any patient for whom the finding is true will remain on the list and those for which the finding is false will be removed from the list.

One additional operation is available that is not related to Boolean logic:

**INSERT FINDING** – this is a special operation that lets you store patient data in the patient list. If the finding rule is based on the term VA-IHD STATION code or VA-PCMM INSTITUTION the patient’s PCMM institution will be stored with the list and when the patient list is displayed there will be a column that lists the PCMM Institution. The patient’s PCMM institution is determined by finding the patient’s PCMM team and then the Institution for the team. When the finding rule is based on any other terms, the “CSUB” data for the term will be stored with the list and can be used in the Patient Demographic Report.

**Rule Set Definition**

- Each rule set has a unique Name. National rule sets will have a name prefixed with “VA-“ or “VA-*“, and cannot be edited.
- Each rule set has a Class. Rule sets defined by a local site must be defined with the LOCAL or VISN Class. Nationally distributed rules sets will be have a NATIONAL class.
- Sequence: This three-digit number defines the order in which the list rules in the rule set will be evaluated.
- The ADD PATIENT operation is always used in the first sequential step, typically 001, to build the initial list of patients which can then be modified by subsequent rules. The ADD PATIENT operation can also be used on subsequent steps to add patients with a particular finding to an existing list of patients.
• Each sequential step uses the patient list from the prior step as the starting list to be added to or deleted from.

• It is good practice to initialize the list with the list rule that produce the smallest number of patients. For example if you need a list of patients with a certain diagnosis seen at specific locations you should initialize the list with the smaller of the two. If a finding list rule is defined with a reminder term that is defined with a computed finding, some special considerations need to be taken. If the computed finding is being used to select from or remove a patient from an existing list, than the typical computed finding can be used. If the computed finding will be used with the ADD PATIENT operation, then the computed finding must be defined with a “List” type.

• Each sequence may include Beginning Date/Time and Ending Date/Time.

• Beginning and Ending date/times are optional fields that can be defined in the List Rule which further restrict the criteria for building the patient list. Alternatively, the reminder term can contain the beginning and ending dates.

• The Patient List field is used for patient list rules. It defines the name of a patient list to be used as the patient source. If this field is defined, it overrides the Extract Patient List Name field.

• Extract Patient List Name field provides a mechanism to automatically generate patient list names for patient lists that are built on a recurring basis by extract runs. The name specified should contain “yyyy” for year and “Qnn” for quarter or “Mnn” for month. The string “yyyy” is automatically replaced by the four digit year and the “nn” is replaced by the number of the quarter or the number of the month. For example, one of the national IHD QUERI rule sets contains the extract patient list VA-*IHD QUERI yyyy Mnn PTS WITH QUALIFY AND ANCHOR VISIT; if an extract was run for November 2005 the resulting patient list would have the name VA-*IHD QUERI 2005 M11 PTS WITH QUALIFY AND ANCHOR VISIT.

In current national rule sets, the Beginning Date and Ending Date/time information is not defined at the Sequence level. It is defined in the Finding Rule, instead of the reminder term. The finding rule (FR) name reflects the dates or the period of time represented by the beginning and ending dates. The national extract patient list name is sent to Austin with related total counts. The patient list names reflect enough information for Austin users to understand which patients the counts are related to. The number of patients on the patient list typically represent one of the patient denominators used for extract reports.
Simple Rule Set definition with one List Rule

This rule set only has one step and it is used to build a list of all patients who had a diabetic diagnosis in the last five years.

Name: RS-DIABETIC PATIENTS
Number: 20
Class: LOCAL

Description:
Rule Type: RULE SET

Component Rules
---------------

Sequence: 001
Seq Beginning Date: BDT-5Y
Seq Ending Date: BDT
Operation: ADD PATIENT
List Rule: FR-DIABETIC DIAGNOSIS
Description: This is a taxonomy for diabetic diagnosis.
Rule Type: FINDING RULE
Reminder Term: DIABETIC DIAGNOSIS

Expanded Rule Set with two List Rules

An example of a more complex rule set builds a list of all diabetic patients who have not had a diabetic eye exam.

Name: RS-DIAB PTS W/O DIAB EYE EXAM
Number: 27
Class: LOCAL

Description:
Rule Type: RULE SET

Component Rules
---------------

Sequence: 001
Operation: ADD PATIENT
List Rule: FR-DIABETIC DIAGNOSIS
Description: This is a taxonomy for diabetic diagnosis.
Rule Type: FINDING RULE
Reminder Term: DIABETIC DIAGNOSIS

Sequence: 002
Operation: REMOVE
List Rule: FR-DIABETIC EYE EXAM
Description:
Rule Type: FINDING RULE
Reminder Term: DIABETIC EYE EXAM
Step 001 initializes the list with all patients who have a diabetic diagnosis and step 002 removes any patients who have had a diabetic eye exam. The result is a list containing all diabetic patients who have not had a diabetic eye exam.

Note: The name of the Rule Set is summarized text representing the combination of the List Rules.

National Rule Set Example

Below is an example of one of the nationally released rule sets for the IHD QUERI extract. The rule set contains four finding rules.

This rule set gets all patients with an IHD Diagnosis documented within 5 years prior to the report start date. This list of patients is modified in sequence 002 to remove all patients that have not had a visit documented for an EPRP clinic location during the reporting month, where T in the Beginning Date
represents the report start date and T in the Ending Date represents the report ending date. This list is further modified in sequence 003 to remove patients that have an AMI diagnosis documented within the past 60 days. The patient list after sequence 003 is further modified by associating each patient’s primary care station and storing the station with each patient in the patient list. National list rules cannot be modified.

Steps to Create a Patient List

This is the sequence of steps to create a patient list:

1. Create list rules (FR, RR, or PLR)
2. Create rule sets
3. Create patient list

You must create list rules first. Once list rules are defined, they can be referenced in a rule set. Once the rule set is defined, the patient list tools can use the rule set to create a patient list.

NOTE: The Reminder Definition that is used in a Reminder Rule must have “L” (Reminder Patient List) in the Usage field or it will not be able to be used in the Reminder Rule

Prior to creating list rules and rule sets, it is a good idea to write down the criteria clearly enough so that anyone else will know exactly how the patient list should be built.

- What patient finding(s) should be used to build the list of patients?
- What finding should be used to create the first list of patients?
- Should this list be modified to remove patients with a particular finding?
- Should this list be modified to remove patients that do not have a particular finding?
- For each finding, what are the appropriate beginning and ending dates?
- What sequence will have the least impact on computer system resources?
- Who should be able to see the patient list?

The criteria for building a reminder patient list can be documented in the description field of the rule set. The criteria should take into consideration the most efficient sequence in which patient extracts should occur, to limit unnecessary impacts on system operations.
Patient List Menu

The Patient List Menu option on the PXRM MANAGERS MENU provides the following options for creating and managing list rules and patient lists.

<table>
<thead>
<tr>
<th>Syn.</th>
<th>Name</th>
<th>Option Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LRM</td>
<td>List Rule Management</td>
<td>PXRM LIST RULE MANAGEMENT</td>
<td>This option allows creation of list rules, which build patient lists and test rule set criteria. Nationally released list rules are used by nationally released extract definitions for national extract runs. There are four types of list rules: Finding Rule, Reminder Rule, Patient List Rule, and Rule Set.</td>
</tr>
<tr>
<td>PLM</td>
<td>Patient List Management</td>
<td>PXRM EXTRACT PATIENT LIST</td>
<td>This option manages reminder patient lists. Local patient lists may be created from list rules, copied to OE/RR teams, copied to other patient lists, or deleted. Local patient lists and national patient lists (from the extract process) are listed. Individual lists may be displayed or printed or used to run health summaries.</td>
</tr>
</tbody>
</table>

List Rule Management Option

The List Rule Management option presents a list of existing reminder rule file entries. The possible actions available for each type of entry are presented in the bottom portion of the screen.

List Rule Management screen example:

```
<table>
<thead>
<tr>
<th>Item</th>
<th>Rule Set Name</th>
<th>Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>VA-*IHD QUERI 412 PTS WITH QUALIFY AND ANCHOR VISIT</td>
<td>NATIONAL</td>
</tr>
<tr>
<td>2</td>
<td>VA-*IHD QUERI 412 PTS WITH QUALIFY AND ANCHOR VISIT ON LLA M</td>
<td>NATIONAL</td>
</tr>
<tr>
<td>3</td>
<td>VA-*IHD QUERI PTS WITH QUALIFY AND ANCHOR VISIT</td>
<td>NATIONAL</td>
</tr>
<tr>
<td>4</td>
<td>VA-*IHD QUERI PTS WITH QUALIFY AND ANCHOR VISIT ON LLA MEDS</td>
<td>NATIONAL</td>
</tr>
<tr>
<td>5</td>
<td>VA-*IHD QUERI PTS WITH QUALIFY VISIT</td>
<td>NATIONAL</td>
</tr>
<tr>
<td>6</td>
<td>VA-*MH QUERI QUALIFYING PC VISIT</td>
<td>NATIONAL</td>
</tr>
<tr>
<td>7</td>
<td>VA-*MH QUERI QUALIFYING MH VISIT</td>
<td>NATIONAL</td>
</tr>
</tbody>
</table>
```

The default view is Rule Set; this screen is used to create, edit, and test rule sets. The Test Rule Set action applies only to rule sets. It can be used to test a rule set before it is used to build a patient list. When you use this action you enter list build beginning and ending dates, and then the rule set processes list rules in the sequential order defined in the rule set. For each sequence/step in the rule set, it shows you the list rule, and if the list rule uses a term or a definition, it shows all the findings and the final dates used for each finding.
Test Rule Set example

Note that a local rule set can use national list rules, mixed with local list rules. Sequence 002 specifies a List Rule that identifies the facility that should receive the counts for the patient in a list.

The Change View (CV) action is used to select the screens for other types of list rules.

Select Item: Quit// CV   Change View

Select one of the following:

F  Finding Rule
P  Patient List Rule
R  Reminder Rule
S  Rule Set

TYPE OF VIEW: F//F
If we select the finding rule view, then the display changes to show the newly selected view.

<table>
<thead>
<tr>
<th>Item</th>
<th>Finding Rule Name</th>
<th>Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>FR-BMI</td>
<td>LOCAL</td>
</tr>
<tr>
<td>2</td>
<td>FR-DIABETIC DIAGNOSIS</td>
<td>LOCAL</td>
</tr>
<tr>
<td>3</td>
<td>VA-*IHD QUERI 412 DIAGNOSIS</td>
<td>NATIONAL</td>
</tr>
<tr>
<td>4</td>
<td>VA-*IHD QUERI AMI DIAGNOSIS WITHIN 60 DAYS</td>
<td>NATIONAL</td>
</tr>
<tr>
<td>5</td>
<td>VA-*IHD QUERI ANCHOR VISIT</td>
<td>NATIONAL</td>
</tr>
<tr>
<td>6</td>
<td>VA-*IHD QUERI ASSOCIATE PRIMARY CARE STATION</td>
<td>NATIONAL</td>
</tr>
<tr>
<td>7</td>
<td>VA-*IHD QUERI DIAGNOSIS</td>
<td>NATIONAL</td>
</tr>
<tr>
<td>8</td>
<td>VA-*IHD QUERI LIPID LOWERING MEDS</td>
<td>NATIONAL</td>
</tr>
<tr>
<td>9</td>
<td>VA-*IHD QUERI QUALIFYING VISIT</td>
<td>NATIONAL</td>
</tr>
<tr>
<td>10</td>
<td>VA-*MH QUERI QUALIFY MH VISIT</td>
<td>NATIONAL</td>
</tr>
<tr>
<td>11</td>
<td>VA-*MH QUERI QUALIFY PC VISIT</td>
<td>NATIONAL</td>
</tr>
</tbody>
</table>

When you are in the desired view, the CR (Create Rule) action is used to create a new list rule and the DR (Display/Edit Rule) action is used to display/edit an existing rule. Note that typing the item number is the same as selecting the DR action.
Patient List Management Option

The Patient List Management option presents a list of available reminder patient lists. The patient lists displayed will include local and national patient lists that you have access to.

Note on national patient lists: The example below includes several national patient lists created by the monthly VA-IHD QUERI extract runs. Each month the VA-IHD QUERI extract was run, there were five different national patient lists created. Each patient list has a unique name with abbreviated text in the patient title to reflect the criteria used to create the list. Each of the five patient lists was used by extract reporting tools to evaluate reminders and create compliance and finding totals. See the section called National Reminder Extract Reporting for more information on Reminder Extract Report processing.

</tbody>
</table>

The actions on this screen are:
- CO (Copy Patient List) – copy an existing patient list to a new patient list
- COE (Copy to OE/RR Team) – copy a patient list to an OE/RR Team list
- CR (Create Patient List) – create a new patient list
- DE (Delete Patient List) – delete selected patient list(s)
- DCD (Display Creation Doc) – display the documentation on how a patient list was created
- DSP (Display Patient List) – display the contents of a patient list
- CV (Change View) – toggles the display order of the list between one sorted by list name and one sorted by list type
- LRM (List Rule Management) – this action takes you to the List Rule Management screen

When creating a local patient list, you are given the option to secure the list or to make it public for all to use. The type of security on the list is available by scrolling the list to the right.

When viewing the list of patient lists, there are two symbols: “<<<” and “>>>” on the action line. These are standard List Manager symbols that mean you can scroll the view to the left using the left arrow key.
and to the right using the right arrow key. If the view is scrolled to the right, you can see the “Type” of list, public (PUB) or private (PVT), and your “Access” to the list full (F) or view (V).

If the list has a Type of PUB, then the list can be used by all users with access to the Patient List Management option. The level of Access may be restricted to View (Read Only), or Full access (Delete, and Update actions).

For any secure list, the creator of the patient list can add additional users to the list and assign one of two permissions to the user; view only or full access.

This is an example of a screen that has been scrolled to the right. Note that the sequence number and patient list name are still displayed on the left side of the column with the Type and Access columns.

**Patient List Creation Action**

When you select the CR (Create Patient List) action, there are a number of prompts that must be answered before the patient list can be created. The following is a detailed explanation of each of these prompts.

**Secure List?**
If the answer to this prompt is “YES,” the list becomes a private list, which means that the only people who can view the list are the creator, anyone who the creator has given view access, and anyone who holds the PXRM MANAGER KEY.

**Purge Patient List after 5 years?**
The response to this prompt sets the value of the Patient List file field AUTOMATICALLY PURGE. Whenever an automatic extract is run, if a patient list is more than 5 years old, AUTOMATICALLY PURGE is checked, and if its value is “YES,” the patient list is deleted.

**Select LIST RULE SET**
This is the rule set that is used to construct the list.

**Enter Patient List BEGINNING DATE**
This prompt is used to enter the values for the list build beginning date. The value entered can be: standard Clinical Reminders symbolic dates like T-5Y, an actual date like 09/30/2005; any of the standard FileMan date formats are acceptable.
**Enter Patient List ENDING DATE**
This prompt is used to enter the values for the list build beginning date. The value entered can be: standard Clinical Reminders symbolic dates like T-5Y, an actual date like 09/30/2005; any of the standard FileMan date formats are acceptable.

**Include deceased patients on the list? N//** The default is to not include deceased patients in patient lists. If the answer to this prompt is “YES,” then deceased patients will be included.

**Include test patients on the list? N//** The default is to not included test patients in patient lists. If the answer to this prompt is “YES,” then test patients will be included.

**Dates in Patient Lists**
When you build a patient list, you are prompted to enter a Beginning Date and an Ending Date; for the purposes of this discussion we will call these the Patient List Beginning Date (PL BDT) and the Patient List Ending Date (PL EDT). There can also be a beginning date and ending date specified for each sequence in a rule set, for a finding rule, and for each finding in a term or definition.

These dates specify the period of time in which to search for patient data so it is important to understand the relationships between the BDT and EDT values at each level. For discussion purposes, the Beginning Date at the sequence, finding rule, and reminder term level is referred to as BDT, and Ending Date is referred to as EDT. For each level, the BDT and EDT values represent the date range that will be used to search for the findings.

The following is the hierarchy of date ranges and options for values that can be defined in the BDT and EDT fields at each level.

1) **Patient List BDT and EDT (required)**

- Patient List BDT and EDT values are entered by the person creating the patient list.
- The Patient List BDT is represented symbolically by “BDT” and may be used in any of the list rule dates.
- The Patient List EDT is represented symbolically by “T” and may be used in any of the list rule dates. If “T” is used in the term or definition date fields it will take the value of the patient list EDT.

2) **Sequence BDT and EDT for each rule in the rule set (optional)**

- Dates defined at the sequence level override those defined at the patient list level.
- Actual dates are used directly.
- Symbolic values can be used for both the BDT and EDT. The symbol “BDT” is equal to the PL BDT so a date such as “BDT-6M” is PL BDT minus 6 months. The symbol “T” is equal to the PL EDT.
- When 0 is entered for BDT it means start at the beginning of patient data and 0 for EDT means ignore PL EDT and use the end of today for the end of the search range.
3) Finding Rule BDT and EDT (optional)

- Dates defined in the finding rule override those defined at the sequence.
- Actual dates are used directly.
- Symbolic values can be used for both BDT and EDT. The symbol “BDT” is equal to the PL BDT so a date such as “BDT-6M” PL BDT minus 6 months. The symbol “T” is equal to the PL EDT.
- When 0 is entered for BDT it means start at the beginning of patient data and 0 for EDT means ignore PL EDT and use the end of today for the end of the search range.

4) Reminder Term and Definition BDT and EDT (optional)

- Each finding can optionally be defined with BDT and EDT values and these will override those defined at the finding rule and/or sequence level.
- Actual dates are used directly.
- Symbolic dates can only use “T” which is equal to PL BDT.

Summary of date range overrides when searching for a particular finding

- The patient list BDT and EDT define the default date range to use to search for a particular finding unless the BDT or EDT is defined for the Rule Set Sequence, Finding Rule, or Reminder Term or Definition Finding.

- For each sequence in the rule set, you can override the Patient List’s BDT or EDT by adding a BDT and EDT for each sequence in the Rule Set.

- For each Finding rule defined in a rule set sequence, you can override the Rule Set Sequence BDT and EDT value and the Patient List’s BDT or EDT value by adding a BDT and EDT for the Finding Rule.

- For each Finding defined in a Reminder Term, you can override the BDT and EDT values at the Finding Rule, Rule Set Sequence and Patient List levels by adding a BDT and EDT for each finding in the Reminder Term or Definition.

- The following table summarizes the possible interactions between the various dates based on a Patient List Beginning Date of Sep 01, 2005 and Ending Date of Sep 30, 2005. This example is creating a patient list for the month of September 2005.

The table columns are as follows:

- Date Range # represents the various examples of how to define the Beginning Date Time (abbreviated in the Date Fields column as BDT) and Ending Date Time (abbreviated in the Date Fields column as EDT) in the four columns (List Build Date Range, Rule Set Sequence, Finding Rule, and Reminder Term Findings)
- The Date Fields column shows BDT or EDT to represent the beginning date/time or ending date/time for each level that beginning and ending dates can be defined (List Build, Rule Set Sequence, Finding Rule, and Reminder Term Finding).
- The List Build column represents the dates you are prompted for when building a patient list. If run from an extract, this column is the extract’s reporting period.
• The Rule Set Sequence column represents date values defined at the sequence level in a rule set.
• The Finding Rule column represents date field values defined in the list Finding Rule.
• The Reminder Term Finding column represents date field values defined at the finding level for a reminder term.
• The Search Date Range for Finding column shows the dates that will be used for each scenario when the list is actually built.

Times can optionally be specified, but if they are not, the beginning date/time defaults to the start of the day and the ending date/time defaults to the end of the day.

Whenever T is used in the Rule Set Sequence, Finding Rule, or Reminder Term Finding columns, T will always be equal to the List Build Ending Date/time.

Whenever BDT is used in the Rule Set Sequence, Finding Rule, or Reminder Term Finding columns, BDT will always be equal to the List Build Beginning Date/time.

</table>
Date Range #1 shows that if no dates are defined at the sequence, finding rule, or reminder term finding level, the List Build dates are used to search for the finding defined in the reminder term.

Date Range #2-7 are examples of the Rule Set Sequence BDT and EDT overriding the List Build BDT and EDT. The Rule Set Sequence BDT and EDT dates are used to determine the date range to use for the finding in the reminder term.

Date Range #2 shows symbolic dates defined at the sequence level using “T”. T is the List Build ending date/time.

Date Range #3 shows symbolic dates defined at the sequence level using ”BDT” (the List Build Beginning Date/time) and “T” (the List Build Ending Date Time).

Date Range #4 shows symbolic dates defined at the sequence level using “BDT” (the List Build Beginning date/time) in both the Rule Set Sequence BDT and EDT fields.

Date range #5 shows 0 (zero) entered as the sequence level beginning date with an actual date specified as the sequence level ending date. The 0 will cause the search for the finding to not limit how far back in history a reminder finding will be looked for, which is similar to the way a finding works in a reminder.

</table>
definition when the finding has a blank beginning date. The actual date entered as the ending date will be used directly, overriding the List Build end date.

Date range #6 shows that when actual dates are defined at the sequence level, they take precedence and are used directly.

Date range #7 shows an actual date specified as the sequence level beginning date, and “0” (zero) entered as the sequence level ending date. The actual date entered as the beginning date will be used directly, overriding the List Build beginning date. The “0” in the Sequence ending date will cause the search for the Reminder Term finding to use the end of the day on the day the patient list is created, overriding the List Build ending date. The actual date specified will be the beginning date, and TODAY@11:59pm will be used as the ending date.

Date Range #8-13 are examples of the Finding Rule BDT and EDT overriding the List Build BDT and EDT. The Finding Rule BDT and EDT dates are used to search for the findings defined in the finding rule’s reminder term.

Date Range #8 shows symbolic dates defined at the finding rule level using “T” (the List Build ending date/time).

Date Range #9 shows symbolic dates defined at the finding rule level using ”BDT” (List Build Beginning date/time) and “T”(List Build Ending date/time. If there is no EDT value defined in the Finding Rule EDT, then the List Build Ending date/time is used.

Date Range #10 shows symbolic dates defined at the finding rule level using ”BDT” (the Patient List Beginning date/time).

Date range #11 shows “0” (zero) entered as the finding rule level beginning date and an actual date specified as the finding rule level ending date. The “0” will cause the search for the finding to not limit how far back in history the finding will be looked for, which is similar to the way a finding works in a reminder definition when the finding has a blank beginning date. The actual date entered as the ending date will be used directly, overriding the List Build ending date.

Date range #12 shows that when actual dates are defined in the BDT and EDT fields at the finding rule level, they override the List Build BDT and EDT.

Date range #13 shows an actual date specified as the finding rule level beginning date, and “0” (zero) entered as the finding rule level ending date. The actual date entered as the beginning date will be used directly, overriding the Patient List beginning date. The “0” (zero) in the finding rule ending date will use the end of the day on the day the patient list is created, overriding the List Build ending date. The date range used to search for the reminder term findings becomes the actual beginning date through the end of the day on the date the list is built(TODAY@11:59pm).

Date Range #14-17 are examples of the Reminder Term Finding BDT and EDT overriding the List Build BDT and EDT. The BDT and EDT dates are used to search for the findings defined in the finding rule’s reminder term.

Date Range #14 shows symbolic dates defined at the finding rule level using “T” (the List Build ending date/time).
Date range #15 shows “0” (zero) entered as the finding rule level beginning date and uses the symbolic BDT (List Build Beginning date/time) as the ending date. actual date specified as the finding rule level ending date. The “0” will cause the search for the finding to not limit how far back in history the finding will be looked for, which is similar to the way a finding works in a reminder definition when the finding has a blank beginning date.

Date range #16 shows that when actual dates are defined in the BDT and EDT fields at the finding rule level, they override the List Build BDT and EDT.

Date range #17 and 18 are examples of what happens when Beginning and Ending date/time values are defined at the List Rule Sequence level and Finding Rule level. The Finding Rule level’s beginning and ending date values will override the List Rule Sequence level’s beginning and ending date values. BDT values are replaced with the List Build beginning date/time and T values are replaced with the Lit Build Ending date/time.

Date range #19 is an example of beginning and ending date values defined at every level, and where the Reminder Term Finding Beginning date/time and Ending date/time override all other levels.

Date range #20-22 is an example of the Reminder Term Findings beginning and ending date/times overriding miscellaneous other levels of beginning and ending date/time definitions.
Creating a Simple Patient List

As an example, let’s build a list of all our diabetic patients.

1. Create a Reminder rule using a reminder term

The first thing we must do is find or create a reminder term that identifies diabetes patients. If you are not familiar with how to do this, see the Reminder Term Management section of this manual. The examples below assume the following Reminder Term defines the criteria to identify diabetes patients.

Diabetic Diagnosis term:

<table>
<thead>
<tr>
<th>Item Rule Set Name</th>
<th>Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 VA-*IHD QUERI 412 PTS WITH QUALIFY AND ANCHOR VISIT</td>
<td>NATIONAL</td>
</tr>
<tr>
<td>2 VA-*IHD QUERI 412 PTS WITH QUALIFY AND ANCHOR VISIT ON LLA M</td>
<td>NATIONAL</td>
</tr>
<tr>
<td>3 VA-*IHD QUERI PTS WITH QUALIFY AND ANCHOR VISIT</td>
<td>NATIONAL</td>
</tr>
<tr>
<td>4 VA-*IHD QUERI PTS WITH QUALIFY AND ANCHOR VISIT ON LLA MEDS</td>
<td>NATIONAL</td>
</tr>
<tr>
<td>5 VA-*IHD QUERI PTS WITH QUALIFY VISIT</td>
<td>NATIONAL</td>
</tr>
<tr>
<td>6 VA-*MH QUERY QUALIFYING PC VISIT</td>
<td>NATIONAL</td>
</tr>
<tr>
<td>7 VA-*MH QUERY QUALIFYING MH VISIT</td>
<td>NATIONAL</td>
</tr>
</tbody>
</table>

The Reminder Term called DIABETIC DIAGNOSIS is defined to use the Finding Item VA-DIABETES to identify whether a patient has a diabetic diagnosis.

Use the Reminder Term to build a List Rule

1a. Select the List Rule Management option.
1b. Select CV to change the view

```
Select one of the following:
F Finding Rule
P Patient List Rule
R Reminder Rule
S Rule Set

TYPE OF VIEW: F// Finding Rule
```

1c. Press Enter to accept the default of Finding Rule

1d. Select CR to create the rule.

```
Item  Finding Rule Name                                             Class
1  VA-*IHD QUERI 412 DIAGNOSIS                                   NATIONAL
2  VA-*IHD QUERI AMI DIAGNOSIS WITHIN 60 DAYS                    NATIONAL
3  VA-*IHD QUERI ANCHOR VISIT                                    NATIONAL
4  VA-*IHD QUERI ASSOCIATE PRIMARY CARE STATION                  NATIONAL
5  VA-*IHD QUERI DIAGNOSIS                                       NATIONAL
6  VA-*IHD QUERI LIPID LOWERING MEDS                             NATIONAL
7  VA-*IHD QUERI QUALIFYING VISIT                                 NATIONAL
8  VA-*MH QUERI QUALIFY MH VISIT                                 NATIONAL
9  VA-*MH QUERI QUALIFY PC VISIT                                 NATIONAL

+ Next Screen  - Prev Screen  ?? More Actions  >>> CV

</tr>
<tr>
<td>4</td>
<td>VA-*IHD QUERI 2001 M01 PTS WITH QUALIFY AND A</td>
<td>8/5/05@11:12:16</td>
<td>0</td>
</tr>
<tr>
<td>5</td>
<td>VA-*IHD QUERI 2001 M01 PTS WITH QUALIFY VISIT</td>
<td>8/5/05@11:12:16</td>
<td>0</td>
</tr>
<tr>
<td>6</td>
<td>VA-*IHD QUERI 2005 M1 412 PTS WITH QUALIFY AN</td>
<td>8/5/05@11:19:42</td>
<td>0</td>
</tr>
<tr>
<td>7</td>
<td>VA-*IHD QUERI 2005 M1 412 PTS WITH QUALIFY AN</td>
<td>8/5/05@11:19:43</td>
<td>0</td>
</tr>
<tr>
<td>8</td>
<td>VA-*IHD QUERI 2005 M1 PTS WITH QUALIFY AND AN</td>
<td>8/5/05@11:19:42</td>
<td>0</td>
</tr>
<tr>
<td>9</td>
<td>VA-*IHD QUERI 2005 M1 PTS WITH QUALIFY AND AN</td>
<td>8/5/05@11:19:42</td>
<td>0</td>
</tr>
<tr>
<td>10</td>
<td>VA-*IHD QUERI 2005 M1 PTS WITH QUALIFY VISIT</td>
<td>8/5/05@11:19:42</td>
<td>0</td>
</tr>
</tbody>
</table>

3b. Select the CR action to Create the Patient List.

Select PATIENT LIST name: DIABETIC PATIENTS 5Y
Are you adding 'DIABETIC PATIENTS 5Y' as a new REMINDER PATIENT LIST? No// Y (Yes)

Secure list?: N// O
Purge Patient List after 5 years?: N// O
Select LIST RULE SET: RS-DIABETIC PATIENTS RULE SET
Enter Patient List BEGINNING DATE: T-5Y (AUG 10, 2000)
Enter Patient List ENDING DATE: T (AUG 10, 2005)
Include deceased patients on the list? N// O
Include test patients on the list? N// O
Queue the CREATE PATIENT LIST for DIABETIC PATIENTS 5Y:
Enter the date and time you want the job to start.
It must be on or after 08/10/2005@15:02:49
Task number 236638 queued.

3c. **Respond to the prompts** as shown to queue a task job that will create the patient list and add the patient list to the REMINDER PATIENT LIST file. Note that the Patient List Name reflects the date range of 5Y. The Name of the Patient List needs to be as specific as possible to understand what patients are in the list. Note: If the desire is to create a new patient list each month with diabetic patients seen during each month, then Beginning Date and Ending Date would reflect the month period, and the name would include the month and year.
### Available Patient Lists

<table>
<thead>
<tr>
<th>Item</th>
<th>Reminder Patient List Name</th>
<th>Created</th>
<th>Patients</th>
</tr>

Enter DSP, and select the item number next to the patient list you want to view.

Notice that this patient list includes a column with PCMM Institution. This information will be included when the rule set includes a list rule with the INSERT FINDING operation and a finding rule based on the reminder term VA-PCMM INSTITUTION or VA-IHD STATION CODE. This list rule should be added as the last step in the sequence of list rules in a rule set to ensure all patients in the final list are associated with a facility.
List Manager actions on the Reminder Patient List screen

- CV (Change View) – this lets you toggle between a view of the patient list sorted by PCMM Institution and patient name or sorted only by patient name
- HSA (Health Summary All) – this lets you run a selected health summary for all the patients on the list
- HSI – (Health Summary Ind) this lets you run a selected health summary for selected patients from a patient list.
- DEM (Demographic Report) – this lets you run a patient demographic report
- ED (Edit Patient List) – if you are the creator of the list you can use this action to edit the name and type of list; if you hold the PXRM MANAGER key you can also edit the creator of the list.
- USR (View Users) – this action is applicable only to private lists. If you are the creator of the list or hold the PXRM MANAGER key you can use this action to give other users either view only or full access to the patient list. You can also remove a user’s access to the list.
Demographic Report

The Demographic Report can be used for a number of purposes, one of which is to facilitate contacting patients to make sure they receive the proper care. You can get a list of the patients and their phone numbers and addresses. The Demographic Report can produce output in a delimited format so that the information can be imported into another application to create personalized letters. If the output is imported into a spreadsheet, further analysis and sorting can be done.

Example

Demographic Report

Reminder Patient List   Feb 22, 2006@18:14:03   Page: 1 of 2

List Name: Diabetic Eye Exam (7 patients)
Created: 08/11/2005@15:16:44   Creator: CRPROVIDER,ONE

Enter your selection(s): (1-7):

Select from the following inpatient items:
1 - WARD LOCATION
2 - ROOM-BED
3 - ADMISSION DATE/TIME
4 - ATTENDING PHYSICIAN
Enter your selection(s): (1-5): 4

Include due status information for the following reminder(s):
1 - Breast Exam
2 - Problem Drinking Screen
3 - Weight and Nutrition Screen
4 - Cholesterol Screen (Male)
5 - Hepatitis C Risk Assessment
6 - Pneumovax
7 - Alcohol Abuse Education
8 - Exercise Education
9 - Advanced Directives Education
10 - Weight
11 - IHD Lipid Profile
12 - MST Screening
13 - Smoking Cessation Education
14 - Diabetic Eye Exam
Enter your selection(s): (1-14): 30

Delimited Report:? Y//ES

DEVICE: HOME// ;;999 HOME
If the rule set used to create the patient list contains a finding rule and the operation is INSERT then the “CSUB” data for the term’s finding will be available for use with the Demographic Report. This could be used to include lab test results in letters that are sent to patients.

**Demographic Report /Mail Merge Patient Data**

This option can be used to generate letters to send to all patients on a list. Follow the steps below to create personalized letters from the Demographic Report.

**Summary of steps:**
1. Run a demographic report against a patient list.
2. Run the report in a delimited output
3. Capture the output in Notepad
4. Clean up the report output
5. Import the Notepad document into MS Excel
6. Import the Excel document into MS Word

**Patient Lists Created by Reminders Due Reports**

Creation of Patient Lists is not limited to the Patient List Management option.

The Reminders Due Report option on the Reminder Reporting menu also provides the ability to save patients evaluated by the Reminders Due Report into a new Patient List that is stored in the Reminder Patient List file.

When you run a Reminders Due Report, you are given the option to save the list of patients to a patient list. Since this requires reminder evaluations for every selected patient, this method of generating a patient list will not be as efficient as generating a patient list from a rule set. Therefore, whenever possible, it is preferable to generate a patient list from a rule set.

Before V.2.0, when you ran a Reminders Due Report, you entered a set of criteria, such as visits to specific locations, which was used to generate a list of patients for which the list of reminders was
evaluated. Now an existing patient list can be used directly in a Reminders Due Report, eliminating the requirement to generate the initial list of patients. This lets you target a Reminders Due Report to a very specific cohort of patients. For example, you could create a list of diabetic patients and then run a Reminders Due Report for this list of patients.

**Patient Lists Created by Reminder Extract Reports**

National patient lists created by the Reminder Extract Reporting functionality are named with a prefix of “VA-” or “VA-*”. These patient lists are created when a national Reminder Extract Parameter definition is used to schedule and run a job. Each national extract parameter is set up so that IRM staff can schedule the job once, and then monthly extract reports will automatically be scheduled for the next month when the current months job is completed. This automated feature is only possible if the IRM staff initiates a job for the first month to be reported.

Alternatively, a Clinical Application Coordinator (CAC) can start the job using options available in the Reminder Extract Management (PXRM EXTRACT MANAGEMENT) option.

**Advantages of Reminder Patient Lists vs Reminder Due Report Lists**

The national reminder patient lists don’t need any setup and are created automatically from the national rule sets defined in the extract parameter criteria. When a national patient list is created, it remains on the computer system for five years, and is deleted automatically after 5 years. The national patient list is available to run with health summaries, or for extract validation.

Local patient lists can be generated using the Reminder Due option, where the report criteria specifies date ranges and locations or providers. However, the only output available is the due report (albeit condensed, if required).

The patient list management option provides health summary reporting from existing patient lists.

The patient list management option allows patients to be identified by finding. If you want a list of diabetic patients who smoke, then the patients are extracted directly from the Reminder Index Global rather than by parsing the visit file. The downside is that list rules and rule sets identifying findings to be collected must be created before a new list can be created. The biggest plus is that since the patient list doesn't involve reminder evaluation, it is quick.

Once a reminder patient list is created, the patient list can be copied to an OE/RR Patient List. To sum up, the patient list management option provides a way to run health summaries on patient lists, copy them to team lists, and quickly build lists for patients with specific finding combinations.
Reminder Extract Tools

Clinical Reminders V.2.0 includes extract tools that enable sites to create extract summary reports based on an extract definition. An extract definition defines extract criteria similar to performance measure criteria. The extract definition specifies what patient lists should be created, which reminders should be run against each patient list, and what kind of totals should be accumulated. An extract run uses the extract definition to create extract totals and stores these results in the Reminder Extract Summary file.

The extract tools were developed to meet generic extract report and transmission needs. The tools provide options to:

- Manage extract criteria
- Manage extract runs (manual and automated)
- Manage transmissions to AAC
- View extract reporting results
- View the list of patients making up the patient denominator

The functionality supports corporate level management analysis by providing reports that:

- Summarize patient reminder compliance totals (not applicable, applicable, due, not due), similar to Reminder Due summary reports
- Summarize finding total counts that reflect the most recent findings resulting from reminder evaluation
- Summarize finding total counts that reflect site activities during the reporting month.

Reminder Extract Menu

The Reminder Extract Menu was new with Clinical Reminders V2.0. This menu uses list manager functionality to help Reminder managers or clinical application coordinators (CACs) track and manage the national, VISN, and local level extract transmissions.

LR List Rule Management is discussed in detail in the Reminder Patient List/List Rule section.
Clinical Reminder Extracts Guide

By REDACTED, Clinical Product Support

We have written this guide in an attempt to be exactly what it says it is – a guide. The things we have learned about extracts have come from countless hours of trying and failing over and over again until we somewhat succeeded. Our intent from this document is to help you learn the mechanics of extracts and how all the pieces fit together to give you the desired results. Our plan is to make this very basic so that even the reminder novice can understand, so if it seems too simple, please humor us in our efforts to explain. Be forewarned that this is not a fast process and will require you to think, to be able to understand what is actually taking place. As you know, if you have worked with us, we will leave it to you to figure it out because just copying what we have done doesn’t help you to learn how it works. You may not be interested in how it works, but that’s too bad ☺! As always, we will help answer any questions by pointing you in the right direction, but still leaving it to your imagination to figure it out. We can also pass along any enhancement ideas to development staff. As we progress and questions arise, we would like to start a Frequently Asked Questions (FAQ) to go along with this guide to help others who will follow (those poor souls) after we are long gone.

I suppose the best way to start is to create an outline as our guide, from alpha to omega. Here are some key points to making this guide more helpful. Any text that you type will be in bold text.

What is an extract?

By definition, the word extract simply means to get, pull, or draw out, usually with special effort, skill, or force. Hopefully we will not need the “force” part or maybe we should “use the force” to help us ☺. So, this means that we want to draw out results from VistA by use of our extract definition. Why should we use an extract? One reason is that we are able to get more precise data due to the flexibility that we have with dates inside the extract definition. This allows you to be able to report almost exact results to your management on performance measure data or whatever type of data is expected of you. Reminder reports definitely have their place for reporting data, but the accuracy you can obtain from extracts is more exact. Another reason is that these can be automatically tasked to run each month, quarter, or year leaving you only to worry about slicing and dicing the data. We will discuss how to do this later on.

Key Components

This section of the guide will give us information on all the components that make up an extract definition and how they work together. We will give examples of each one as we complete the components.

Finding Rules

Finding Rules – this type of list rule uses a reminder term to achieve the desired result. Let’s look at an example from VistA. You have to use a little forethought when creating a finding rule. It is always best to already have the term that you will use created as you will not be able to create the finding rule without the term embedded. Just like all terms, you may have mapped findings with any number of combinations of beginning date/time(s), ending date/times, or conditions associated with the mapped findings. The menu option that is used to navigate to creating list rules is as follows:

1. From the Reminder Managers Menu, choose PL, then choose LRM.
2. This will take you to a window that is very similar to dialogs.
3. When you access these menus, the screen that is displayed is the window that displays all of your rule sets.
4. To change to the window that contains your finding rules, at the “Select Item” prompt, type CV for change view (exactly like dialog windows) and press Enter.
5. To access your finding rules, take the default of “F” at the “Type of View” prompt. This will take you to the finding rules. Anytime you want to change from one type of list rule to another, i.e. finding rule to patient list rule, you will use the CV option. This same navigation is used to access the other types of list rules and I will not ask you to have to read this again for each section. Just remember for the next sections how to navigate to the type of list rule you are wanting.
6. After you are in the window you want to be in, choose CR to create a new finding rule.

<table>
<thead>
<tr>
<th>Select FINDING RULE to add: FR DIABETIC PATIENTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Are you adding 'FR DIABETIC PATIENTS' as a new REMINDER LIST RULE (the 344TH)? No//</td>
</tr>
<tr>
<td>Y (Yes) Used by: Not used by any rule set</td>
</tr>
<tr>
<td>NAME: FR DIABETIC PATIENTS Replace</td>
</tr>
<tr>
<td>SHORT DESCRIPTION:</td>
</tr>
<tr>
<td>CLASS: L LOCAL</td>
</tr>
<tr>
<td>REMINDER TERM: TUS DIABETES DIAGNOSIS (Extract) LOCAL ...OK? Yes//</td>
</tr>
<tr>
<td>(Yes)</td>
</tr>
</tbody>
</table>

The reminder term must already exist at time of entering into the field. Cannot be created on the fly.

Most of the types of findings that can be defined in the reminder term have a Global Index (PXRMINDX) for across-patient look-ups. However, the Global Index (^PXRMINDX) is not used for computed findings linked to a reminder term, unless the computed finding has hard-coded logic to access the Global Index. The typical computed finding assumes that the patient is already selected and does not support across-patient look-up. However, with V2.0, a computed finding can be specifically created for list-building purposes by defining the Type field in the computed finding definition as “List.” The List type computed finding can be used as the first rule or any subsequent rule in a rule set where the ADD PATIENT Operation is used. When a computed finding is used to SELECT or REMOVE patients from an existing patient list, a “single” or “multiple” type computed finding may be used.

What does all this actually mean to the user?

1. Any type of finding can be used as a mapped item of a term inside of a Finding Rule as the first sequence, except for Computed Findings (CF)
   a. One exception to the above is a CF of a LIST type. LIST type CF’s can only have the ADD PATIENT operator function; therefore, it can be used as the first sequence of a rule set.
   b. If you are using a CF in any other sequence than the first, you may use SINGLE, MULTIPLE, or LIST types of CF. Just remember, if you use the LIST type, the operator must be ADD PATIENT. If you use the SINGLE or MULTIPLE as any sequence but the first, you may use any operator. How do I find out what type of CF I have?
A finding rule will evaluate as TRUE if any mapped finding in the reminder term contained within the finding rule is true. If the Finding rule is true, then the logical operator associated with that finding rule will be invoked within the rule set which it is contained in, i.e. ADD PATIENT, SELECT, REMOVE.

Reminder Rules

Reminder Rules – This type of list rule uses an embedded existing reminder definition to achieve the desired results. Some important things to know about a reminder rule:

1. The embedded reminder definition must be an “L” usage type
2. In a reminder rule, ONLY the cohort logic is evaluated. If you have resolution logic, it will not be evaluated, but it also will not cause problems 😊
3. The cohort string cannot start with a logical “NOT”
4. The cohort string cannot contain a logical “OR NOT”
5. If AGE is used in the cohort logic string, then a baseline age range must be defined
6. If SEX is used in the cohort logic string, the reminder must be sex-specific
7. SEX cannot be the first element of the cohort logic string unless it is followed by AGE
8. If a finding sets the frequency to 0Y, which effectively removes the patient from the cohort, it can’t have an associated age range

Wow, a lot of limitations here!!! Reminder rules have their place, but they are not used as often as finding rules.

From the List Rule Management options, choose the Change View option (CV) and then select “R” for reminder rules, then select CR to create a rule

VistA example of creating a reminder rule

Select REMINDER DEFINITION RULE to add: RR FLU HIGH RISK
Are you adding 'RR FLU HIGH RISK' as a new REMINDER LIST RULE (the 345TH)? No// Y (Yes)

Used by: Not used by any rule set

NAME: RR FLU HIGH RISK//
SHORT DESCRIPTION:
CLASS: L LOCAL
REMINDER DEFINITION: AM HIGH RISK FLU LOCAL
LIST RULE ENDING DATE/TIME:
Input your edit comments.
Edit? NO//
Again, the reminder definition AM HIGH RISK FLU must meet all the criteria outlined above for reminder rules for it to function.

The LIST RULE ENDING DATE/TIME field is essentially the evaluation date, similar to using the reminder test option’s evaluation date/time. If you leave this blank, TODAY will be assumed.

To sum all the above up, when using a reminder rule in a rule set as a sequence, the results obtained from the reminder rule will be the cohort logic only of the reminder definition being used. Again, all of the other constraints on reminder rules will apply.

**Patient List Rules**

*Patient List Rules*- Patient list rules are exactly what their name implies they are -- rules that are based on an existing patient list. When using patient list rules in extracts, you can create a patient list rule that will be used by the extract that is based on a patient list that doesn’t exist yet, but will exist when the patient list rule is used. If this doesn’t make sense now, hopefully it will very soon! We will cover this idea of using a patient list rule based on a list that doesn’t exist in just a bit.

A patient list can be created three ways:

1. Creating a patient list when running a reminders due report (there is a prompt to create a patient list)
2. Creating the patient list from a rule set within a Patient List Management option
3. Creating a patient list when a rule set is invoked within an extract run

From the List Rule Management options, choose the Change View option (CV) and then select “P” for reminder rules, then select CR to create a rule

```
Select PATIENT LIST RULE to add: AJM EXTRACT
   Are you adding 'AJM EXTRACT' as a new REMINDER LIST RULE (the 417TH)? No// Y (Yes)

Used by: Not used by any rule set

NAME: AJM EXTRACT //
SHORT DESCRIPTION: 
CLASS: L LOCAL
USE EXISTING PT LIST: AJM EXTRACT LIST
Input your edit comments.
Edit? NO//
```

As stated above, once a patient list exists, then it may be used as a sequence of a rule set as a patient list rule. Any of the logical operators (mentioned in the Rule Set section) may be used in conjunction with the patient list rule within the rule set.

Let’s now discuss the anomaly of using a patient list that doesn’t exist, but will exist at the time of evaluation. This will only happen when using rule sets within extracts. This is an advanced concept and may take a while to totally grasp….

When a rule set which is composed of finding rules, reminder rules, and patient list rules (not necessarily all of them, but at least one or a combination) is invoked within an extract definition set to run, by design,
a patient list will be created. In the example below, you will see the field within the extract sequence that asks the user for the name of the patient list that will be created. Other fields are listed, but disregard these at this point.

```
Select EXTRACT SEQUENCE: 8// 1       RS NEXUS COHORT (Extract)
EXTRACT SEQUENCE: 1//
LIST RULE SET: RS NEXUS COHORT (Extract) //
EXTRACT PT LIST NAME: NEXUS COHORT Mnn yyyy Replace
INCLUDE DECEASED PATIENTS: YES //
INCLUDE TEST PATIENTS: NO //
Select REMINDER SEQUENCE:
```

So, you have the concept that when the extract runs, each sequence within the extract will invoke a rule set and will create a patient list. Let’s say, for example, that sequence one in our hypothetical extract is a rule set to create a Nexus Cohort and sequence two would be to create a diabetic cohort which is a smaller subset of the Nexus Cohort group….again, without understanding what a “Nexus Cohort” is, let’s put this in general terms.

Once the rule set for Nexus Cohort runs and creates a patient list (let’s say that that list has 1500 patients) we would like to use that patient list (1500 patients) as a starting point to create a separate refined list that only contains diabetics, and let’s say that list has 750 patients.

At this point, our cohort would be patients that met the nexus definition AND who are diabetic (750 of 1500 patients). Since extracts process in sequence, our first sequence is to create the nexus cohort (and create a patient list, of 1500 patients, by using a rule set) and then the second sequence would use THAT patient list of 1500 as a starting point to further refine down to the diabetic cohort, 750 of 1500 patients.

The way that this is accomplished is that the second sequence of the extract uses a rule set that starts out using a patient list rule that is based on the patient list created in the first sequence of the extract. In essence, immediately following the creation of the patient list for Nexus Cohort, we use that patient list within a patient list rule to start out creating our diabetic cohort.

Maybe a picture will be worth a thousand words:

**Extract Definition**

- **Sequence 1:** Nexus Cohort rule set  
  A patient list of patients is created who meet the criteria of the rules in the rule set
- **Sequence 2:** Diabetic cohort rule set  
  This rule set begins with a patient list rule that is based on the patient list created from sequence one.

```graphviz
   Extract sequence 1 – Nexus cohort rule set
   `\rightarrow` Nexus cohort patient list created from rule set
   `\rightarrow` Patient List rule based on nexus cohort patient list
   `\rightarrow` Nexus ‘patient list rule’ used in Diabetic Cohort rule set in extract sequence 2
```
Extract Definition in VistA

**EXTRACT SEQUENCE: 1/**

  LIST RULE SET: RS NEXUS COHORT (Extract)/** ⇐ This is the rule set to build nexus cohort

  EXTRACT PT LIST NAME: NEXUS COHORT Mnn yyyy ⇐ This is the patient list that will be created when the rule set is completed. Don’t worry about the Mnn yyyy for now.

  INCLUDE DECEASED PATIENTS: YES/**

  INCLUDE TEST PATIENTS: NO/**

  Select REMINDER SEQUENCE:

Here is the breakdown of the RS NEXUS COHORT (Extract) rule set:

  Name:  RS NEXUS COHORT (Extract)
  Number:  110
  Class:  LOCAL

Description:

  Rule Type:  RULE SET

Component Rules
---------------

  Sequence: 1
  Operation: ADD PATIENT
  List Rule: <some list rule>

  Sequence: 2
  Operation: <some logical operator>
  List Rule: <some list rule>

  Sequence: 3
  Operation: <some logical operator>
  List Rule: <some list rule>

Next, the second sequence of the extract runs after the first is completed. Here is the second sequence:

**Select EXTRACT SEQUENCE: 2 \ RS FACILITY DM MEASURES**

**EXTRACT SEQUENCE: 2/**

  LIST RULE SET: RS FACILITY DM MEASURES/** ⇐ This is the rule set to build diabetes cohort

  EXTRACT PT LIST NAME: FACILITY DM MEASURES Mnn yyyy ⇐ This is the patient list that will be created when the rule set is completed. Again, don’t worry about the Mnn yyyy for now.

  INCLUDE DECEASED PATIENTS: NO/**

  INCLUDE TEST PATIENTS: NO/**

  Select REMINDER SEQUENCE:

Here is the expansion of the RS FACILITY DM MEASURES rule set:

  Name:  RS FACILITY DM MEASURES
  Number:  281
  Class:  LOCAL

Description:

  Rule Type:  RULE SET

Component Rules
---------------
Use Extract PT List Named: NEXUS COHORT Mnn yyyy _HERE is the key connection! If you can understand this, you are well on your way to understanding the complete process!_ In the set-up of the patient list rule, the field USE EXTRACT PT LIST NAMED entry must be the name of the patient list created from sequence 1 of the extract. Look above in that field of extract sequence 1 and see that entry is the same as what you see in the patient list rule EXTRACT PT LIST NAMED field.

Sequence: 2: Whatever happens based on the operator (ADD PATIENT, SELECT, REMOVE) of this sequence will start with the patients that met the NEXUS COHORT (patients who are “in” the nexus list)

  Operation: <some logical operator>
  List Rule: <Some List Rule>

Sequence: 3

  Operation: <some logical operator>
  List Rule: <Some List Rule>

Each patient list has a unique name and is stored in file 810.5 (REMINDER PATIENT LIST). These can be overwritten with a subsequent run of an extract or a reminder report.

Rule Sets

Rule sets are a sequence of steps that are made up of list rules that are connected together with a logical operator. The three types of list rules are:

1. Finding Rule
2. Reminder Rule
3. Patient List Rule

To create/Edit any of the above, you must be in LIST RULE MANAGEMENT which is a sub menu of PATIENT LIST MANAGEMENT from the main reminders menu. Take a look here and notice all the options you have available at the bottom of the screen.

The types of logical operators that connect each sequence within the rule set are as follows:

1. Add Patient (like the Boolean “OR”)
2. Select (like the Boolean “AND”)
3. Remove (like the Boolean “AND NOT”)

Sequence:

<table>
<thead>
<tr>
<th>Operation: ADD PATIENT</th>
</tr>
</thead>
<tbody>
<tr>
<td>List Rule: PL NEXUS COHORT</td>
</tr>
<tr>
<td>Nexus list created from sequence 1 of the extract</td>
</tr>
<tr>
<td>Rule Type: PATIENT LIST RULE</td>
</tr>
</tbody>
</table>

Description:

| Rule Type: PATIENT LIST RULE |

| Here is the patient list rule that is based on |

| Here is the key connection! If you can understand this, you are well on your way to understanding the complete process! |

| In the set-up of the patient list rule, the field USE EXTRACT PT LIST NAMED entry must be the name of the patient list created from sequence 1 of the extract. Look above in that field of extract sequence 1 and see that entry is the same as what you see in the patient list rule EXTRACT PT LIST NAMED field. |
Let’s think about it like a train that is connected together, except that trains usually are not in a logical sequence whereas we hope our rule set is. For this example, we will use generic names for our list rules. Example: `<ADDPATIENT>FINDING RULE 1<SELECT>FINDING RULE 2<REMOVE>REMINDER RULE 1

Now let’s use a real-life example to further illustrate a rule set and see what are result is from the rule set.
Finding Rule for Diabetic Patients –FR DIABETES
Finding Rule for A1C Lab test >9.0 – FR HGBA1C>9.0
Finding Rule for age >75 – FR AGE>75
`ADD PATIENT`<FR DIABETES>`SELECT`<FR HGBA1C>9.0`<REMOVE>`FR AGE>75

So, what are the results of this rule set? Diabetic patients who have a lab test of HGBA1C greater than 9.0 and who are 75 years of age or younger. Is that what you came up with? If not, stop a minute and think about the results. The first sequence (FR DIABETES) found our diabetic patients; then from those patients, we used sequence two (FR HGBA1C>9.0) to select (AND) the ones who had a HGBA1C greater than 9.0. Next we used sequence three (FR AGE>75) to remove (AND NOT) patients who were over the age of 75.

**Using Reminders to obtain data in the extract**

So far, all we have from the Extract is nothing but a list of patients. We will continue to use the diabetes example. Our list now contains diabetic patients who have met the Nexus Cohort restrictions. Now what?? This list of patients is the APPLICABLE or our denominator. How do we get our numerator?

To obtain our numerator, we need to run reminder definition(s) against this patient list. To do this, we have to add in reminders to our extract definition. Reminders that already exist can be used for this, but most of the time, you will want to make a copy of an existing reminder and make edits or create a new one from scratch. The main reason to not use an existing reminder is that you will normally not need any cohort logic because your cohort has been built within the rule sets of the extract definition. This makes for faster evaluation of the reminders leading to quicker availability to data. Also, a lot of reminders have a DUE IN ADVANCE TIMEFRAME entry and this would affect your data.

Let’s discuss some rules that will apply to the reminders that will be used in the extract.

1. The USAGE filed needs to have an * or an X.
2. Cohort logic must contain something. If your rule set has entirely built your cohort, your reminder still must have something. I would suggest using a customized logic string of SEX
3. All other things about reminders would apply as normal when they are evaluated in the extract
How do I enter the reminder definitions into my extract definitions?

When you go back and edit your extract definition, you choose the appropriate sequence number. For this example, it would be the sequence number dealing with the diabetes section. As you scroll through the fields, you will see a field named ‘Select REMINDER SEQUENCE’. Here you would enter a sequence number, then enter in the .01 name of the reminder definition (not the print name). More than one reminder can be entered for each sequence of the extract definition. You would just need to give each reminder that you add a distinct sequence number. You will notice in the example below that the reminder definition has an (X) at the end. This is actually part of the reminder definition given by the person who created the reminder definition.

```
Select EXTRACT SEQUENCE: 2       RS FACILITY DM MEASURES
EXTRACT SEQUENCE: 2//
LIST RULE SET: RS FACILITY DM MEASURES//
EXTRACT PT LIST NAME: FACILITY DM MEASURES Mnn yyyy
Replace
INCLUDE DECEASED PATIENTS: NO//
INCLUDE TEST PATIENTS: NO//
Select REMINDER SEQUENCE: 145// 100       DM A1C W/I LAST YEAR (X)
REMINDER SEQUENCE: 100// ←Reminder Sequence number (arbitrary number)
REMINDER: DM A1C W/I LAST YEAR (X)// ←Reminder definition
COUNTING RULE
Select REMINDER SEQUENCE:
```

Dates and how they affect your data

Remember that the patient lists are created from a rule set. The RULE SET TEST option within LIST RULE MANAGEMENT (specifically within RULE SETS area) is a great tool to let you know what your dates actually will be for your rule set, once it starts running. An example of the RULE SET TEST will be shown later.

There is a logical hierarchy within extracts. Within an extract, there exist many pieces and within these pieces, there are possibilities for date entries along the way. For example:

- Extract runs MUST have a beginning date/time and ending date/time
  - A Rule Set has the possibility for entry of a beginning date/time and ending date/time
    - A finding rule within a rule set has the possibility for entry of a beginning date/time and ending date/time
      - A reminder term in a finding rule has the possibility for entry of a beginning date/time and ending date/time
        - Within the reminder term, the mapped findings have the possibility for entry of a beginning date/time and ending date/time
So, if you had different dates in more than one place, which date would be used? The answer to this question is the date at the lowest level would trump a date at a higher level. Some things to think about when adding dates:

1. If you are using a reminder term in an extract, remember if you add dates at the term level or mapped item level within the term, they will also affect how that term is used any other place.
2. If a finding rule has dates, and it is used in more than one rule set, the dates may need to be different in each rule set within which they are used. This is a possible place for errors.
3. My inclination would be to put my dates at the highest level possible unless a piece at a lower level is specific to that one rule set.

Below is an example of using RULE SET TEST option. This example was testing the RS NEXUS COHORT rule set using the month of June. You can see that not all dates are 6/1-6/30. This means that there was a different date entered at a lower level within the rule set.

```
Enter Patient List BEGINNING DATE: 0601  (JUN 01, 2010)
Enter Patient List ENDING DATE: 0630  (JUN 30, 2010)
List Build Beginning Date: 06/01/2010
List Build Ending Date: 06/30/2010

SEQUENCE 1 FR NEXUS COHORT
Operation: ADD PATIENT
TERM TUS NEXUS CLINIC (Extract)
  FINDING 1-RL.NEXUS CLINIC COHORT FY08
    Beginning Date/Time: 06/01/2010
    Ending Date/Time: 06/30/2010@23:59:59

SEQUENCE 2 FR ANCHOR VISIT
Operation: SELECT
TERM TUS ALL LOCATIONS (Extract)
  FINDING 1-RL.VA-ALL LOCATIONS
    Beginning Date/Time: 06/01/2008
    Ending Date/Time: 05/02/2009@23:59:59

SEQUENCE 3 VA-FR-DATE OF DEATH
Operation: REMOVE
TERM VA-DATE OF DEATH
  FINDING 1-CF.VA-DATE OF DEATH
    Beginning Date/Time: 0
    Ending Date/Time: 05/31/2010@23:59:59

SEQUENCE 4 FR VA VETERAN
Operation: SELECT
TERM TUS VA VETERAN
  FINDING 1-CF.VA-VETERAN
    Beginning Date/Time: 06/01/2010
    Ending Date/Time: 06/30/2010@23:59:59
```
## Extract Definitions

This section of the guide will help you learn how to set up your extract definition. It is important to have all your pieces ready (rule sets, reminder definitions) to add into your extract definitions. Some good advice would be to create a “map” before you even start building any pieces of the extract, i.e. reminder terms, finding rules, reminder rules, patient list rules, etc.

Once you have your rule sets complete and have tested them to ensure that you will get the proper data returned by the dates you have entered along the way, it is time to add them to your extract definition. You may be creating your extract definition from scratch or you may be editing an already existing definition. Think about the sequential order that your extract needs to run — which rule set needs to run first. If you have a rule set that depends on something to be created (a patient list) to make it work, then the rule set that creates needs to be prior, sequentially.

### To add a new extract or edit an existing one:

1. Use the XM menu option from the Reminder Managers menu,
2. Choose ED option.
3. Choose CR or DE, depending on what you need to do.

Below is a screen shot from VistA on creating a new extract definition. It includes all the field entries and responses you will need to know about at this time. Also, don’t be concerned at this point about the Mnn yyyy that you see below. This will be explained later.

| Select EXTRACT DEFINITION to add: **EXTRACT FOR GUIDE** |
| Are you adding 'EXTRACT FOR GUIDE' as |
| a new REMINDER EXTRACT DEFINITION (the 20TH)? No/\ Y (Yes) |
| NAME: **EXTRACT FOR GUIDE**/ |

| Are you adding '5' as a new EXTRACT SEQUENCE (the 1ST for this REMINDER EXTRA (Yes) |
| EXTRACT SEQUENCE LIST RULE SET: RS NEX |
| 1 RS NEXUS COHORT (Extract) RULE SET |
| 2 RS NEXUS COHORT (LIST) RULE SET |
| 3 RS NEXUS IMMUNIZATION REPORT FY08 RULE SET |
| 4 RS NEXUS WITH DM OR IHD AND VETERAN RULE SET |
| CHOOSE 1-4: 1 **RS NEXUS COHORT (Extract)** RULE SET |
| LIST RULE SET: RS NEXUS COHORT (Extract)// |
| EXTRACT PTR LIST NAME: **PATIENT LIST FOR NEXUS COHORT Mnn yyyy** |
| INCLUDE DECEASED PATIENTS: **n NO** |
To summarize the extract definition:

1. Extract definition is made up of rule set(s) which are processed in sequence and a patient list is created when each rule set completes. This list of patients makes up your applicable group or denominator for the specific rule set. Another way to say this is that if you have 5 rule sets, you will have 5 patient lists, therefore 5 applicable groups.

2. Reminder definitions can optionally be evaluated against the patient list created from each sequence of the extract definition. Once the reminder definitions are evaluated, the DUE patients make up your numerator.
Running the Extract

There are two ways to create or start an extract:

1. Manual
2. Automatic

Manual Method

This makes the extract start processing the rule sets in the sequence that is contained within the extract definition.

1. Again, you will access the XM menu from the reminder managers menu,
2. then choose the MA menu option,
3. then choose the VSE action. When you choose the VSE action, you need to make sure your extract definition appears in the list to be able to choose it. Choose your extract definition, then choose the ME action for “manual extract”.
4. At the Select EXTRACT PERIOD (Mnn/yyyy): // prompt, choose your reporting month and year in the syntax of Mnn/yyyy. So, if your reporting month was June of 2010, at the prompt, you would enter M06/2010.

At this point, you may be thinking about the Mnn yyyy in the extract definition. What happens when you choose your month and year for the manual extract to run? Anywhere you have defined Mnn yyyy in the name of the patient lists created from the rule set, M06 2010 will be substituted for the Mnn yyyy. After your extract completes, you can go to the patient list management section of reminders and you will NOT see a list with a literal Mnn yyyy in the name, but you will see M06 2010 instead. Magic!! 😊.

Now you just have to let the extract complete. The time it takes will depend on how many rule sets, how many reminders you are evaluating, and the complexity of the reminders.

After the extract completes, if you are a member of your local reminders mail group, you will receive a VistA mail message that the extract is complete.

5. To view your results, access the XM menu, the MA menu and then choose the VSE action. You will see your completed extract on the screen. Choose the number that corresponds to your extract and you will be able to view your results.
6. At the Select Action prompt, take the default of ES. You should see data for the reminders that you defined in your extract in the format of TOTAL, APPL., N/A, DUE and NOT DUE.

Below is a screen shot from VistA to demonstrate what you should see.

```
Extract Summary Name: FACILITY MH PM 2010 M06
Extract Period: 06/01/2010 - 06/30/2010   Created: 07/28/2010@22:49:15

<table>
<thead>
<tr>
<th>Item</th>
<th>Patient List/Station/Reminder</th>
<th>Total</th>
<th>Appl.</th>
<th>N/A</th>
<th>Due</th>
<th>Not Due</th>
</tr>
</thead>
<tbody>
<tr>
<td>679/DM A1C W/I LAST YEAR</td>
<td>807</td>
<td>807</td>
<td>0</td>
<td>74</td>
<td>733</td>
<td></td>
</tr>
<tr>
<td>679/DM A1C&gt;9.0</td>
<td>807</td>
<td>807</td>
<td>0</td>
<td>732</td>
<td>75</td>
<td></td>
</tr>
</tbody>
</table>
```

You may be wondering why there is 0 in the N/A column. This is because we used the rule set for our cohort, not the reminder definition. This is one of the reasons extracts are more efficient because there is less evaluation time due to the fact that everybody on the patient list is in the cohort.
Automating the extract process

This will involve your IRM department. They will have to create an option, set that option in TaskMan Management Options and queue it to run monthly. Then in FileMan, you/IRM will have to set a field to make sure the correct reporting period is being accessed. We will discuss this in detail below.

Step 1. Create the new option in VistA. You can give it a unique name to your system.
- Access the XUMAINT option from the programmer prompt or another way would be to access MENU MANAGEMENT option from the EVE menu.
- At the Select Menu Management Option, choose EDIT.

```
Select Menu Management Option: EDIT options

Select OPTION to edit: TUS MONTHLY PM  MONTHLY PC PM  \unique name for your site, you will be asked to add this as a new option (since my option already existed, I was not prompted to add as new)
NAME: TUS MONTHLY PM//
MENU TEXT: MONTHLY PC PM/  \Choose a name for the MENU TEXT
PACKAGE: CLINICAL REMINDERS//  \Choose CLINICAL REMINDERS as the PACKAGE
OUT OF ORDER MESSAGE:
LOCK:
REVERSE/NEGATIVE LOCK:
DESCRIPTION: enter some descriptive text for this option
This option is for use within Clinical Reminder extracts. This option is tasked monthly by taskman utility

   Edit? NO//
TYPE: run routine//
HEADER:
ENTRY ACTION: D AUTO^PXRMETX("FACILITY MONTHLY PM","Y")
   Replace  \The yellow highlighted text is the NAME of your extract definition you want to run
EXIT ACTION:
ROUTINE:
CREATOR: CRPROVIDER, ONE//  \This field will be automatically filled in by the creator
HELP FRAME:
PRIORITY:
Select TIMES PROHIBITED:
Select TIME PERIOD:
RESTRICT DEVICES?:
Select PERMITTED DEVICE:
```

Step 2: Go to TaskMan and set this option to run monthly.
- Access the menu option XUTM MGR from the programmer prompt or the TASKMAN MANAGEMENT option from the EVE menu.
- Then choose Schedule/Unschedule Options.
• Select TaskMan Management Option: schedule/Unschedule Options

Select OPTION to schedule or reschedule: tus monthly PM  MONTHLY PC PM  
the option created from step 1
...OK? Yes// (Yes)
(R)

Edit Option Schedule
Option Name: TUS MONTHLY PM
Menu Text: MONTHLY PC PM                        TASK ID: 8824177

QUEUE TO RUN AT WHAT TIME: JUL 3,2010@03:00  
(set the date to run after the first  
of the next month. Make sure it doesn’t conflict with any other tasks

DEVICE FOR QUEUED JOB OUTPUT:

QUEUE TO RUN ON VOLUME SET:

RESCHEDULING FREQUENCY: 1M  
Set the option’s frequency to monthly

TASK PARAMETERS:

SPECIAL QUEUEING:

Step 3: Give FileMan a starting month to start the automatic extract. This will be a one-time entry. Once you create your extract definition, it will be visible in the file.

• From the FileMan Menu, choose “Enter or Edit file entries”
• Choose file 810.2 (REMINDER EXTRACT DEFINITION)
• Then choose your extract definition.
• Then you will need to add an entry to the “NEXT REPORTING PERIOD/YEAR” field. The NEXT REPORTING PERIOD would be the month immediately preceding the month that is defined as your report queue date in TaskMan. For example, if your beginning report queue date in TaskMan is July 3, 2010, your NEXT REPORTING PERIOD would be June 2010 (M06/2010).

Once you have completed steps 1-3, your extract will be set up to automatically run each month, NO MAINTENANCE NECESSARY!! Nice!! 😊 You will only have to go get the results from the Extract menus as described before.

Even though you have set the extract to run automatically, you can still make manual runs of your extract at any time. Do remember that these can be system-intensive, so take care to run this at off times. If your extract is small, then this will not be an issue.
Understanding your Output

Now that you have data, what does it all mean? We mentioned earlier about the Applicable number being your denominator and the DUE number being your numerator. Once you have those numbers, it is as simple as doing the math, or having an excel spreadsheet do the math for you!

So, for an example, let’s say for HGB A1C>9.0 for diabetics performance measure you have 1000 applicable patients from the extract and you have 100 patients that have A1C>9.0 lab value. Then you are 90% compliant on diabetic patients having A1C<9.0.

FAQ:

1. Q. How do I know what type of Computed Finding I have, i.e. Single, Multiple or List?
   A. One way is to use the CFL option from the CF management menu option from the Reminder Managers menu. Enter the name of the specific CF and check the TYPE field entry. Another way is to look this up in FileMan from file #811.4 and check the TYPE field entry.

2. Q. Reminder rules require the use of a reminder definition which must be “L” type. How do I find out what usage type my reminder definition is?
   A. From the Reminder Managers menu, choose RM, then RI, and look for the entry in the USAGE field.

Access to National Extracts at Austin Information Technology Center (AITC)

1) Go to REDACTED, which will require you to enter your national access username e.g:
   User: VHAXXXXX\vhaissxxxx
   Password: enter your national password

2) Register for access to Austin system to get customer ID and initial logon password
   Go to the Austin Information Technology Center web page.
   Select Publications and Forms on the service desk webpage
   Under the Forums category: Select VA FORM 9957
Clinical Reminder Order Checks

Changes with PXRM*2.0*45
The orderable item multiple has been removed in order check groups.
The pharmacy item multiple has been renamed to order check item groups. The patch will
automatically add your existing items to the order check item group.
Two new order check types were added
• Imaging Type
• VA Product

Sites can create their own CPRS Order Checks using Clinical Reminder Definitions or Terms.

Sites will be able to create local order checks using the Clinical Reminder functionality. These
Order Checks will occur at the time the user clicks on the accept button when placing an order in
CPRS. The set-up of a Clinical Reminder Order Check consists of two parts:

• Creating an Order Check Item Group that can contain Orderable Items, Imaging types, or
entries from the Drug #50, VA Drug Class #50.605, VA Generic #50.6, or VA Product
#50.68 files. (For the purpose of this document entries for Drug, VA Drug Class, VA
Product, or VA Generic will be referred to as Pharmacy Items).

• Creating the rules that will be applied to the orderable item when accepting an order in
CPRS. It will be possible to have the same orderable item or pharmacy items in multiple
groups. Each rule assigned to the different groups will be evaluated when placing the
orderable item in CPRS.

The Order Check Items are stored in file #801. The Order Check Rules are stored in file 801.1.
When an order is placed in CPRS, the reminder order check will find all order check item
groups that contain the orderable item. It will also find all reminder order check item
groups that contain a pharmacy item that the orderable item is part of.

Note: Sites should evaluate all requests to create a Clinical Reminder Order Check to determine
the importance of adding it. Using many reminders in an order check could affect performance in
the order check system.

File #801 stores a pointer to an entry in the Orderable Item file (#101.43). The reminder Order
Check file will not automatically be updated with changes to the Orderable Item file, such as
inactivating an existing orderable item, or if an ancillary package adds an item to the Orderable
Item file.

The entries in Reminder Order Check Items Group file (#801) need to be evaluated by the site
anytime an update is done to the Orderable Item file, file #101.43. The site will need to
determine if it needs to remove an orderable item from an existing group or if it needs to add an
orderable item to existing group. The pharmacy items assigned to entries in the Reminder Order
Item Group file will be automatically evaluated at the time of ordering.
The Reminder Order Check Menu... contains five options:

<table>
<thead>
<tr>
<th>Abbr</th>
<th>Option name</th>
<th>File Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

When entering the editor or the inquiry options, you are presented with options to look up the order check item group or the rules by the name or the components that make up rules or the order check items group:

**For Order Check Items Group**
- N: ORDER CHECK ITEM GROUP NAME
- C: VA DRUG CLASS
- D: DRUG
- G: VA GENERIC
- I: IMAGING TYPE
- O: ORDERABLE ITEM
- P: VA PRODUCT
- R: ORDER CHECK RULE
- Q: QUIT

**For Order Check Rules**
- N: ORDER CHECK RULE NAME
- R: REMINDER DEFINITION
- T: REMINDER TERM
- Q: QUIT
Reminder Order Check Items Group Test [PXRM ORDERABLE ITEM TESTER]
This option provides a way for the user to test the order check functionality in VistA. The option requires the selection of a patient and either an orderable item or a drug from file 50. This duplicates the process of placing an order in CPRS or finishing a medication in backdoor pharmacy. The output shows the results for all the appropriate reminder rules. In addition, the output shows some internal results that are not displayed in CPRS. The internal results are the evaluation results of a reminder definition or a reminder term. The evaluation result will start with "INTERNAL:". It also specifies if no rules are found for the different values in the testing flag and the severity fields. If a rule is found and it evaluates as false, the TESTER will display "RULE FAILED.”

Description of the setup fields for Reminder Order Check Items Group:
- Group Name: This is the name of the Orderable Group
- Description: Sites should use this field to describe the types of Orderable Items that should be defined in this Group.
- Order Check Item Group: This field will allow sites to store a list of orderable items, imaging types, Drug, VA Drug Class, VA Products and/or VA Generic entries. When an order is placed in CPRS, the orderable item will be expanded to determine the drug, drug class, or the generic that it is associated with. If one of these items is found in one or more Order Check Items Groups, then the corresponding rules will be evaluated.
- Each Order Check Items Group can have multiple rules defined.

Description of the setup fields for Reminder Order Check Rule:
- Rule Name: This is the internal name of the rule.
- Display Name: This is the external name; the value in this field appears in the order check form in CPRS, if the rule triggers an order check.
- Status Flag: This field determines if the rule is inactive, set for production use, or for testing use. If the rule is set to INACTIVE, then the rule will not be evaluated for the orderable item list. The value should be set to TESTING when a rule is first created so the creator of the rule can test it before turning it on for the entire facility. To turn it on for the entire facility, this field must be set to PRODUCTION.
• CPRS Order Check Flags
  o Clinical Reminder Live: This rule allows all users access to the Clinical Reminder Order Checks.
  o Clinical Reminder Test: This rule should only be assigned to a smaller group of users. This order check rule and the testing field are used to allow the users to test the rule before allowing every user at the site access to the rule

- Clinical Reminder Live: Off
- Clinical Reminder Test: On

• Severity Flag: This field determines if the rule should require an override reason in the order check dialog. The three options are Low, Medium, and High. A severity of High will require the user enter an override reason for the order check when signing the order.

• Rules can either be defined to run against a reminder term or a reminder definition. A reminder term is beneficial when the request is to evaluate the presence of specific data. (See Example #1). A reminder definition is beneficial if you need the full functionality of a reminder definition to determine if the rule should show in the order check form (See Example #2). The user can only define one or the other. If users define a reminder term, they will be prompted to answer the fields that are for a reminder term. If users do not select a reminder term, they need to select a reminder definition and the associated fields.

• Reminder Term: This is a pointer value to the reminder term.
  o Term Evaluation Status: Reminder Term evaluation results are either True or False. This field lets the user determine if the rule should display in the order check form by selecting which reminder term status should be used.
  o Order Check Text: This is the order check text that will display in CPRS.

• Reminder Definition: This field will show if a reminder term is not defined. This is a pointer to the reminder definition.
  o Definition Evaluation Status: This field determines which reminder evaluation results cause the rule to appear in the order check form. The three possible values are:
    ▪ Due: A selection of DUE will cause the rule to appear in the order check form if the reminder has a status of DUE NOW or DUE SOON.
    ▪ Applicable: A selection of APPLICABLE will cause the rule to appear in the order check form if the reminder has a status of DUE NOW, DUE SOON, or RESOLVED.
    ▪ N/A: A selection of N/A will cause the rule to appear in the order check form if the reminder has a status of N/A or NEVER.
Output Text: This field controls which text should appear in the order check form. This field can have one of three possible values:

- Order Check Text Only: This value will only display the text defined by the user in the order check text field.
- Definition Text Only: This value will display the text of the reminder evaluation. This text is similar to the Clinical Maintenance Output except it will not include the Status Line and the Frequency line in the output.
- Both Order Check and Definition Text: This value will display the Order Check Text followed by the definition evaluation text.

Order Check Text: This is the order check text that will display in CPRS.

Example #1

Problem:
Order Check needed for the interaction between timolol ophthalmic (used to treat glaucoma) and OTC antihistamines (which should not be used in the more rare narrow angle glaucoma).

Setup:
1. Create a reminder term that looks for the presence of a diagnosis of narrow angle glaucoma. (May need to look at multiple files depending on your site practice)
2. Create an Order Check Items Group that contains all orderable items for any OTC Antihistamines.
3. Create a Rule that contains the term created in step 1.
4. Set the rule to trigger the order check if the reminder term is evaluated as True.
5. Create the text that should appear in the order check window.

Example of the Output in CPRS.
Description of solution: A reminder term was used in the setup because the presence of Glaucoma was all that is needed to determine if the rule should trigger an order check. In the screen shot above, the text “Diagnosis of Glaucoma” was defined in the Display Name field. The rest of the text was defined in the Order Check Text field.

Example #2:

Problem:
Order Check is needed when ordering Glyburide for patients age 65 or greater and serum Cr 2.0 or greater.

Setup:
1. Create a reminder definition that is applicable to the patient if the patient age is 65 or greater and the patient has a CR serum 2.0 or greater.
2. Create an Order Check Items Group that contains all orderable items for the Glyburide.
3. Create a Rule that contains the definition created in step 1.
4. Set the rule to trigger the order check if the reminder definition is applicable to the patient.
5. Create the text that should appear in the order check window. Set the order text to display the finding output in the order check text.

Example of the output in CPRS

![Order Checking](image)

Laboratory test: CREATININE; specimen SERUM
11/17/2009 value - 2.5 H
Description of solution:
We needed a reminder definition to match patients older than 64 who had a lab test with the results greater than 2. In this example we set the rule up to display both the order check text and the definition evaluation text. The text "Glyburide Contraindicated" is defined in Display Name field. The text "Avoid glyburide in patients with a calculated creatinine clearance < 50 ml/min or a creatinine 2 or greater. If an oral sulfonylurea is required, consider glipizide," is defined in the order check text field. The rest of the text is returned from the reminder definition evaluation.

Example #3

Problem:
Order check desired to remind providers that the recommended dose of dabigatran (Pradaxa®) is reduced in the presence of declining renal function.

Setup:
1. Create a reminder term that will identify patients with reduced renal clearance. The package insert for Pradaxa® suggests a threshold of 30 mL/min creatinine clearance, but a serum creatinine level above 2.0 mg/dL approximates the same degree of renal function.

2. Create a reminder order check rule that calls the reminder term created in step 1 when its status is TRUE. The rule also contains the text that will appear in the order check window.

3. Create an order check item group for the dabigatran pharmacy item. You can do this at the VA GENERIC level (e.g., DG.DABIGATRAN) at the DRUG level (e.g., DABIGATRAN 75MG CAP) or at the ORDERABLE ITEM level (e.g., DABIGATRAN CAP, ORAL). Note that even if you use a specific strength at the drug level, all strengths will be order checked because CPRS actually uses the Orderable Item to perform the checks.

4. Connect the rule to the order check item group using the Add/Edit Reminder Order Check Items Group option.

Example of the Output in CPRS:

<table>
<thead>
<tr>
<th>1 of 4</th>
<th>Remote Order Checking not available - checks done on local data only</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 of 4</td>
<td>Dabigatran and Renal Function</td>
</tr>
<tr>
<td></td>
<td>The dose of dabigatran should be reduced to 75mg PO BID when the patient's creatinine clearance is estimated to be less than 30 mL/min.</td>
</tr>
</tbody>
</table>

### Definitions

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applicable</td>
<td>A reminder is applicable when a patient’s findings meet the patient cohort reminder evaluation.</td>
</tr>
<tr>
<td>Boolean Logic Operators</td>
<td>Boolean operators are connectors used to produce more relevant/precise search results: : ! (OR), &amp; (AND), !’ (OR NOT), and &amp;' (AND NOT)</td>
</tr>
<tr>
<td>CNBD</td>
<td>Cannot Be Determined. If a frequency can’t be determined for a patient, the Status and Due Date will both be CNBD and the frequency display that follows the status line will be “Frequency: Cannot be determined for this patient.” When reminder evaluation is disabled the status will be CNBD.</td>
</tr>
<tr>
<td>Clinical Reminder</td>
<td>A clinical reminder is a software decision support tool that defines evaluation and resolution logic for a given clinical activity. The evaluation logic defines conditions in the database including the presence or absence of specified criteria such as diagnoses, procedures, health factors, medications, or demographic variables (e.g., age, gender). A reminder may or may not require provider resolution, depending on its purpose and design, through a user interface, also known as a reminder dialog. Also, in accordance with the underlying logic, reminders may be used to collect specified patient information that may or may not be related to the dialog.</td>
</tr>
</tbody>
</table>
| Cohort                      | Patient Cohort  
Patient Cohort Logic  
This is the logic that specifies how findings are used to select the applicable patient population; i.e., the patient cohort. It is based on Mumps Boolean operators and their negations. The operators are: ! (OR), & (AND), !’ (OR NOT), and &' (AND NOT).                                                                                                                                                                                                                               |
| Component                   | A component represents the module that is presented in any given template.                                                                                                                                                                                                                                                                                                                                                                                                  |
| Computed Findings           | A custom MUMPS routine used to find some specific patient characteristic. Computed findings are used when none of the standard findings will work. Sites can create their own computed findings                                                                                                                                                                                                                                                                                    |
| CSUB                        | CSUB values are used in the CONDITION field to do a comparison to numeric or string values. Using +V causes the CSUB data to be interpreted as
<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>numeric. Strings that cannot be converted to a number are set to zero. For example, a CONDITION such as I +V(&quot;CHECK-OUT DATE/TIME&quot;)&gt;0 would be true if the appointment had a check-out date/time. When a Reminder Test is run, some elements of the FIEVAL array will have a “CSUB” subscript. Example for an orderable item finding:</td>
<td>FIEVAL(5,&quot;CSUB&quot;,&quot;DURATION&quot;)=1774 FIEVAL(5,&quot;CSUB&quot;,&quot;ORDER&quot;)=3366^CA ULTRA^546;99RAP FIEVAL(5,&quot;CSUB&quot;,&quot;RELEASE DATE&quot;)=3010917.1625 FIEVAL(5,&quot;CSUB&quot;,&quot;START DATE&quot;)=3010917 FIEVAL(5,&quot;CSUB&quot;,&quot;STATUS&quot;)=PENDING FIEVAL(5,&quot;CSUB&quot;,&quot;STOP DATE&quot;)= FIEVAL(5,&quot;CSUB&quot;,&quot;VALUE&quot;)=PENDING Each of the subscripts following “CSUB” may be used in a Condition (hence the abbreviation Condition SUBscript); for example: I V(&quot;DURATION&quot;)&gt;90</td>
</tr>
<tr>
<td>Dialog Element</td>
<td>A dialog element is defined primarily to represent sentences to display in the CPRS window with a check-box. When the user checks the sentence off, the FINDING ITEM in the dialog element and the ADDITIONAL FINDINGS will be added to the list of PCE updates, orders, Mental Health Notification Purposes, and mental health tests. The updates won't occur on the CPRS GUI until the user clicks on the FINISH button. Dialog elements may have components added to them. Auto-generated components will be based on the additional prompts defined in the Finding Type Parameters. Once a dialog element is auto-generated, the sites can modify them. Dialog elements may also be instructional text or a header. The FINDING ITEM and components would not be defined in dialog elements.</td>
</tr>
<tr>
<td>Dialog Group</td>
<td>A dialog group is similar to menu options. It groups dialog elements and dialog groups within its component. The dialog group can be defined with a finding item and a check-box. The components in the group can be hidden from the CPRS GUI window until the dialog group is checked off.</td>
</tr>
<tr>
<td>Due</td>
<td>A reminder is DUE for a patient if the patient is in the cohort, and has not yet had the treatment, medication, education, etc., that is being searched for by the reminder.</td>
</tr>
<tr>
<td>Finding Item</td>
<td>A Finding Item is a piece of information that can be searched by the reminder.</td>
</tr>
<tr>
<td>Function Findings</td>
<td>Function Findings (FF) do computations on the results from regular findings. Function Findings can be used just like regular findings with one exception, there is no date associated with an FF, which means the Resolution Logic cannot be written so that it is made true solely by FFs. Besides providing new and expanded functionality, FFs can make custom logic much simpler to understand.</td>
</tr>
<tr>
<td>Health Factors</td>
<td>A health factor is a computerized component that captures patient information that for which no standard code exists, such as Family History of Alcohol Abuse, Lifetime Non-smoker, No Risk Factors for Hepatitis C, etc.</td>
</tr>
<tr>
<td>Mental Health Assistant</td>
<td>The Mental Health Assistant is a national VA software package that is used for administration and scoring of standardized self-report questionnaires and tests. It is integrated with clinical reminders in that mental health assistant instruments can be administered through a reminder dialog. Also the results of a specific instrument overall score, scale score, or specific item response can be used as a finding in reminder logic. This is the mechanism, for</td>

</tr>
<tr>
<td><strong>Term</strong></td>
<td><strong>Definition</strong></td>
</tr>
<tr>
<td>Presenting questionnaires for screening for common mental health issues such as the AUDIT-C for alcohol misuse.</td>
<td></td>
</tr>
<tr>
<td>Prompt</td>
<td>An aid on the screen in the form of a question or statement indicating the options available. Prompts are defined for PCE, MH Notification Purpose, or as locally created comment check-boxes.</td>
</tr>
<tr>
<td>PXRM</td>
<td>Clinical Reminder package namespace</td>
</tr>
<tr>
<td>Reminder Component</td>
<td>A reminder component is any element, or part thereof, of a reminder, including the reminder’s definitions, dialogs, findings, terms, cohort logic or resolution logic.</td>
</tr>
<tr>
<td>Reminder Definition</td>
<td>The reminder definition is the internal logic of the reminder. It describes the patients the reminder applies to, how often it is given, and what resolves or satisfies the reminder. It is comprised of the predefined set of finding items used to identify patient cohorts and reminder resolutions.</td>
</tr>
<tr>
<td>Reminder Dialog</td>
<td>The reminder dialog is the display, which is seen by the user in the CPRS Graphical User Interface (GUI), when opening a reminder. Reminder dialogs are used in CPRS to allow clinicians to select actions that satisfy or resolve reminders for a patient. Information entered through reminder dialogs updates progress notes, places orders, and updates other data in the patient’s medical record. A reminder dialog is created by the assembly of components in groups into an orderly display.</td>
</tr>
<tr>
<td>Reminders Exchange</td>
<td>The Clinical Reminders Exchange Utility provides a mechanism for sharing reminder definitions and dialogs among sites throughout the VA or among sites within a VISN. Exchanging reminders helps to simplify reminder and dialog creation. It also helps to promote standardization of reminders based on local, VISN-wide, and national guidelines.</td>
</tr>
<tr>
<td>Reminder Extracts</td>
<td>The Clinical Reminders application provides extract tools that enable sites to create extract summary reports based on an extract definition. An extract definition defines extract criteria similar to performance measure criteria. The extract definition specifies what patient lists should be created, which reminders should be run against each patient list, and what kind of totals should be accumulated. An extract run uses the extract definition to create extract totals and stores these results in the Reminder Extract Summary file.</td>
</tr>
<tr>
<td>Reminder Finding</td>
<td>Reminder finding is a type of data element in the Veterans Health Information and Technology Architecture (VistA) that determines a reminder’s status. Finding type This refers to the source of the finding, such as the files for Drugs, Education Topics, Exams, Health Factors, Immunizations, Laboratory Tests, Mental Health Instruments, Orderable Items, Radiology Procedures, Reminder Computed Findings, Reminder Taxonomies, Reminder Terms, Skin Tests, VA Drug Class, VA Generic, and Vital Measurements.</td>
</tr>
<tr>
<td>Reminder Location List</td>
<td>Location Lists are a new finding type introduced in version 2.0. They provide a way to give a name to a list of locations. A Location List is built from two types of entries: Hospital Location, file #44 and Clinic Stop, file #40.7. There is a multiple for Hospital Locations and a multiple for Clinic Stops in the Location List file, so when you build a list of locations, you can use Hospital Locations and/or Clinic Stops.</td>
</tr>
<tr>
<td>Reminder Patient List</td>
<td>A list of patients that is created from a set of List Rules and/or as a result of report processing. Each Patient List is assigned a name and is defined in the</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>--------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Reminder Patient List File</td>
<td>Reminder Patient Lists may be used as an incremental step to completing national extract processing or for local reporting needs. Patient Lists created from the Reminders Due reporting process are based on patients that met the patient cohort, reminder resolution, or specific finding extract parameters. These patient lists are used only at local facilities.</td>
</tr>
<tr>
<td>Reminder Term</td>
<td>A reminder term is a predefined finding item(s) that are used to map local findings to national findings, providing a method to standardize these findings for national use.</td>
</tr>
<tr>
<td>Reminder Test</td>
<td>The Reminder Test option provides a convenient tool that can be used as an aid in setting up new reminders and tracking down problems with existing ones. It lets you evaluate a reminder without going through CPRS or Health Summary. Reminder Test now allows a Browser view, which improves some viewing of details.</td>
</tr>
<tr>
<td>Resolution</td>
<td>A reminder is considered RESOLVED (or SATISFIED) if the conditions defined by the reminder resolution logic have been met. For example, if a reminder exists for influenza immunization, giving a flu vaccine satisfies or resolves that reminder. Likewise, ordering lab tests or drugs or giving patient education can resolve a reminder.</td>
</tr>
<tr>
<td>Result Element</td>
<td>A result element contains special logic that uses information entered during the resolution process to create a sentence to add to the progress note. The special logic contains a CONDITION that, when true, will use the ALTERNATE PROGRESS NOTE TEXT field to update the progress note. A separate result element is used for each separate sentence needed. The result element is only used with mental health test finding items. Default result elements are distributed for common mental health tests, prefixed with PXRM and the mental health test name. Sites may copy them and modify their local versions as needed.</td>
</tr>
<tr>
<td>Result Group</td>
<td>A result group contains all of the result elements that need to be checked to create sentences for one mental health test finding. The dialog element for the test will have its RESULT GROUP/ELEMENT field defined with the result group. Default result groups for mental health tests are distributed with the Clinical Reminders package. Sites may copy them and modify their local versions as needed.</td>
</tr>
<tr>
<td>Term</td>
<td>A TERM is a collection of findings grouped together to make one concept.</td>
</tr>
<tr>
<td>TIU</td>
<td>Text Integration Utilities (TIU) simplifies the access and use of clinical documents for both clinical and administrative VAMC personnel, by standardizing the way clinical documents are managed. TIU accepts document input from a variety of data capture methodologies. Those initially supported are transcription and direct entry. TIU allows upload of ASCII formatted documents into VISTA.</td>
</tr>
</tbody>
</table>
Appendix B: Clinical Reminder Order Checks Example

NOTE: PXRM*2#22 changed the method for creating Order Checks, by using ScreenMan functionality. For those not familiar with ScreenMan, a brief overview follows.

ScreenMan Overview

The redesigned Reminder Order Check functionality uses ScreenMan. ScreenMan is VA FileMan's *screen-oriented* data entry tool. It is an alternative to the Scrolling Mode approach. With ScreenMan, data is entered in *forms*. Each form field occupies a fixed position on the screen (instead of scrolling off!). You can see many data fields at once, and use simple key combinations to edit data and move from field to field on a screen. You can also move from one screen to another like turning through the pages of a book. *For a detailed explanation of using ScreenMan, please refer to the VW FileMan Getting Started manual.*

The ScreenMan Screen

```
GROUP NAME: VA-WH HIRISK CONTRACEPTIVES GROUP

ORDER CHECK ITEM LIST (39 entries)
REMINDER ORDER CHECKS RULES LIST (1 entry)

CLASS: NATIONAL
SPONSOR: Women Veterans Health Program
REVIEW DATE:

Press Enter to edit the Order Check Item List.
```

ScreenMan Descriptions
Fields are usually composed of a data element and a caption. ScreenMan displays data elements in high intensity (boldface) and other text in regular intensity. Text that identifies a data element is called a caption and is usually followed by a colon (:). A caption and its associated data element are together called a field. Captions of required fields are underlined; to save any changes you make on the form, required fields must contain data.

**How to Navigate Between Fields and Pages**

There are a number of ways you can move the cursor from field to field on a form (i.e., navigate). This is to provide you with as much flexibility as possible so that you can work quickly and efficiently with forms.

You can use the keystrokes listed in the following table to move the cursor to various fields located on a ScreenMan form:
<table>
<thead>
<tr>
<th>To</th>
<th>Press</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move to the next field (to right or below).</td>
<td>&lt;Tab&gt;</td>
</tr>
<tr>
<td>Move to the previous field (to left or above).</td>
<td>&lt;PF4&gt;</td>
</tr>
<tr>
<td>Move to the field above.</td>
<td>&lt;ArrowUp&gt;</td>
</tr>
<tr>
<td>Move to the field below.</td>
<td>&lt;ArrowDown&gt;</td>
</tr>
<tr>
<td>Move to the next field in the pre-defined edit sequence.</td>
<td>&lt;Enter&gt;</td>
</tr>
<tr>
<td>Edit a WORD-PROCESSING field.</td>
<td>At field, press &lt;Enter&gt;</td>
</tr>
<tr>
<td>Select a Subrecord in a Multiple.</td>
<td>At field, press &lt;Enter&gt;</td>
</tr>
<tr>
<td>Move to the next block on current page.</td>
<td>&lt;PF1&gt;&lt;PF4&gt;</td>
</tr>
<tr>
<td>Jump to a specific field.</td>
<td>^ followed by Caption of field and &lt;Enter&gt;</td>
</tr>
<tr>
<td>Jump to the Command Line.</td>
<td>^&lt;Enter&gt;</td>
</tr>
<tr>
<td>Move to next page</td>
<td>&lt;PF1&gt;&lt;ArrowDown&gt; or &lt;PageDown&gt;</td>
</tr>
<tr>
<td>Move to previous page</td>
<td>&lt;PF1&gt;&lt;ArrowUp&gt; or &lt;PageUp&gt;</td>
</tr>
<tr>
<td>Move to a page you specify</td>
<td>&lt;PF1&gt;P</td>
</tr>
</tbody>
</table>

**Saving and Exiting**

To SAVE or EXIT the form, you need to reach ScreenMan's command line. It's reachable from any ScreenMan screen. To reach the command line, do any one of the following:

- Enter a caret ("^") at any field prompt.
- Press <Enter>, <Tab>, or <PF4> to move from field to field until you reach the command line.
- Press <ArrowDown> or <ArrowUp> to move the cursor from field to field downwards or upwards, until you reach the command line.

Then you can enter SAVE or EXIT at the command line (see below).

**Word-Processing Fields**

To edit or display a WORD-PROCESSING field, press the Enter/Return key at the WORD-PROCESSING field. This clears the screen and passes control to your Preferred Editor to edit the field. If you do not have a Preferred Editor, the Screen Editor is used. When you exit the editor, you return to the ScreenMan screen.

**Multiples Linked to "Pop-Up" Subpages**

A Multiple field can appear on a page and be linked to a regular or "pop-up" subpage. When you navigate to the Multiple field, select a Subrecord, and press the Enter/Return key, you are taken to the subpage, which contains the fields within the Multiple.
In the following illustration, the Multiple is the field with the caption "Select EMPLOYMENT HISTORY:". When you enter "FEB 1,1950" at this field, you are taken into a "pop-up" subpage, where you can edit the fields for that particular Subrecord:

![Employee Profile Page]

**Exiting a Subpage**

While in a subpage, your only Command Line options are CLOSE and REFRESH. You cannot EXIT, Quit, or SAVE until you return to the parent page. You can return to the parent page by pressing <PF1>C or issuing the CLOSE command at the Command Line. From there, you can select another Subrecord to edit or navigate to another field.
Order Check Example

**Purpose:** Design an Order Check for dabigatran (Pradaxa®) to remind providers about dose reduction when creatinine clearance is less than 30 mL/min

This example uses serum creatinine values greater than 2 mg/dL to focus more on the order check than on the lab result

1. **Create a reminder term that will identify patients with reduced renal clearance.**
   (Patients with Cr > 2 mg/dL)
   
   | Select Reminder Term Management Option: TE Add/Edit Reminder Term |
   |----------------------|-------------------------|
   | Select Reminder Term: ZZ CREATININE > 2 (TERM) |
   | Are you adding 'ZZ CREATININE > 2 (TERM)' as a new REMINDER TERM (the 1215TH)? No// Y (Yes) |
   | REMINDER TERM CLASS: L LOCAL |
   | NAME: ZZ CREATININE > 2 (TERM) Replace CLASS: LOCAL// |
   | Reminder Term has no findings! |
   | Select Finding: LT. CREATININE |
   | Are you adding ' CREATININE' as a new FINDINGS (the 1ST for this REMINDER TERM)? No// Y (Yes) |
   | Editing Finding Number: 1 |
   | FINDING ITEM: CREATININE// |
   | CONDITION: I V>2 |

2. **Create a reminder order check rule that calls the reminder term created in step 1 when its status is TRUE.** The rule also contains the text that will appear in the order check window.
   - Each RULE exists as a part of the OI Group
   - That allows you to set up multiple rules that apply to the same list of drugs
   
   | Select Reminder Managers Menu Option: ROC Reminder Order Check Menu |
   |----------------------|-------------------------|
   | Select Reminder Order Check Menu Option: RE Add/Edit Reminder Order Check Rule |
   | Select Reminder Order Check Items Group by one of the following: |
   |----------------------|-------------------------|
   | N: ORDER CHECK ITEMS GROUP NAME |
   | C: VA DRUG CLASS |
   | D: DRUG |
   | G: VA GENERIC |
   | O: ORDERABLE ITEM |
   | R: ORDER CHECK RULE |
   | Q: QUIT |
   | Select Reminder Order Check Items Group by: (N/C/D/G/O/R/Q): N// R ORDER CHECK RULE |
Select REMINDER ORDER CHECK RULES RULE NAME: DABIGATRAN AND RENAL FUNCTION

Are you adding 'DABIGATRAN AND RENAL FUNCTION' as a new REMINDER ORDER CHECK RULES (the 4TH)? No// Y (Yes)

RULE NAME: DABIGATRAN AND RENAL FUNCTION
DISPLAY NAME: DABIGATRAN AND RENAL FUNCTION
ACTIVE FLAG: YES
TESTING FLAG: YES
SEVERITY: MEDIUM
TERM: <Enter>

When you press Enter after Term:, a box pops up and prompts you for the Term name and Term Evaluation Status.

REMINDER TERM: ZZ CREATININE > 2 (TERM)
TERM EVALUATION STATUS: TRUE

Either a Term or a Definition must be defined; if you don’t enter a Term, the prompt appears for DEFINITION.

DEFINITION <Enter>

REMINDER DEFINITION:
| DEFINITION EVALUATION STATUS: |
| OUTPUT TEXT: |

When you press Enter after Term:, a box pops up and prompts you for the Term name

ORDER CHECK TEXT:

Order Check Text and Rule Description are word-processing fields. When you press Enter, a word-processing screen opens up.

==[ WRAP ]==[ INSERT ]========< ORDER CHECK TEXT >========[ <PF1>H=Help ]

The dose of dabigatran should be reduced to 75mg PO BID when the patient's creatinine clearance is estimated to be less than 30 mL/min.
3. Create an Order Check Item Group

Similar ScreenMan actions and word-processing fields shown in the example above apply in this option.

Select Reminder Managers Menu Option: ROC Reminder Order Check Menu
Select Reminder Order Check Menu Option: GE Add/Edit
Reminder Order Check Items Group
Select reminder order check items group by: (N/C/D/G/O/R/Q): N/
<Enter>

ORDER CHECK ITEM GROUP NAME

Reminder Order Check Item Group: DABIGATRAN AND RENAL FUNCTION
Are you adding 'DABIGATRAN RENAL FUNCTION' as
a new REMINDER ORDER CHECK ITEMS GROUP (the 4TH)? No// Y (Yes)

-- ORDER CHECK ITEM LIST -----------------------------------------------
  . DR.DABIGATRAN ETEXILATE 150MG ORAL CAP Word-

process field
  .
4. Connect the rule to the order check item group using the Add/Edit Reminder Order Check Items Group option.

5. In CPRS, turn off the Clinical Reminders Live Order Check.
• Set the rule’s testing flag to True.
• Set the group’s Active Flag to True.
• Run the Reminder Order Check Test option to validate that the active rule shows for each patient.
• In CPRS, place a corresponding order for the order group for each test patient.
• Validate that only the active rule shows in the order check form.
Result

Order Checks

To cancel an order select the order by checking the checkbox and press the "Cancel Checked Order(s)" button.

If the order check description is cut short, hover over the text to view the complete description.
