1. Preface

1.1 Scope of Manual
This manual provides technical information required to effectively set up and use the Veterans Health Information Systems and Technology Architecture (VistA) Lexicon Utility. It also contains material useful in linking to the Lexicon Utility.

1.2 Audience
This manual's intended audience is Information Resource Management (IRM) personnel, Applications Coordinators (ADPACs), Clinical Coordinators, and developers.

1.3 Related Manuals
- Lexicon Utility User Manual
- Lexicon Utility Installation Guide
2. Introduction

VistA’s Lexicon Utility is a dynamic dictionary of medical terms. The Lexicon maps coding schemes such as ICD-10, SNOMED CT, and DSM to major medical concepts. Currently, there are 36 different coding schemes represented in the Lexicon. The Lexicon Utility can support other coding schemes that are unique to the VA, such as the codes used by the Social Work Service or US Code Title 38 Chapter 4 for Service Connected Disabilities.

Working with outside sources, the Lexicon updates its terminology as the source files incorporate new terminologies and classification codes. The flexibility offered by this approach is tremendous. The Lexicon can draw from sources such as CMS, AMA and APA while maintaining compatibility with VA authoritative files. The Lexicon adjusts new terminology for use in the VA while retaining backward compatibility with older coding schemes (for example, transition from DSM-IIIR to DSM-IV). Updates to the Lexicon are exported on a periodic basis.

The Lexicon supports usage by all clinical areas. With the mapping of application-specific term files, such as radiology, medicine, etc., to the Lexicon, Veterans Health Administration (VHA) achieves standardized clinical terminology. Terminology associated with Hybrid Open System Technology (HOST) applications can also be mapped to the Lexicon. This standardization on the part of VistA and HOST applications permits information mobility within VHA and with other industry-wide systems.

A specially designed interface permits the user to enter a medical term using familiar natural language. The computer codifies and stores this term, permitting retrieval and analysis by a wide variety of legitimate users of clinical data. This interface captures exactly what the user enters and maps it to a standardized term that is linked to a major concept. An application using the Lexicon can reflect what the user actually entered while maintaining the links to the needed coding system and the Lexicon.

The Lexicon's initial implementation was with the Problem List Application Version 1.0. It was completed on September 6, 1994 and released to the field on January 28, 1995.

The initial release of the utility was conceived and planned as a proof of concept. While not complete, the design of the Lexicon includes the ability to evolve as new demands are placed upon it.

3. Clinical Lexicon Version 1.0 (GMPT)

The following software requirements have been stated for the Lexicon Utility:

3.1 Problem List Expert Panel

- Single unique concepts
- Must support natural/native terminology
- All terms must map to ICD-9 (rescinded)
- Must specifically include problem list terminology from NANDA, Social Work, and Dental, as well as clinical findings and symptoms or other terminologies (to be identified)

- Must be flexible enough to map various coding schemes (examples follow)

</tbody>
</table>

- Must be usable by a variety of applications and utilities within VistA
- Must support addition of terms at the site level (rescinded)
- Must be able to migrate to a nomenclature selected for use throughout VistA when that decision occurs
- Site modification to include edit display text (rescinded) and site specific shortcuts and synonyms (MTLU for v1.0, context sensitive shortcuts for v2.0)
3.2 End User Requirements

- Group terms by clinical categories (e.g., ICD-9 Major Clinical Categories)
- Place the most frequently used terms at the top of the selection list
- Accept the provider narrative if the search fails or the term was not found
- Build subsets of terms (based on specialty or clinic) restricting the lookup domain

3.3 Application Requirements

- Provide Silent Lookup using a multi-term search (CPRS)
- Build shortcuts for terms (based on specialty or clinic) gaining immediate access to terms without the benefit of a search (PL)
- Provide shortcut as a user default (PL)
- Add CPT terminology and codes to the Lexicon Utility (multiple applications)
- Provide entry point to retrieve an internal entry number based on a code from a classification system (PCE)

4. Lexicon Version 2.0 (LEX)

Terminology

Terminology added since v1.0:
- Diagnostic and Statistical Manual of Mental Disorders (DSM-IV)
- International Classification of Diseases (ICD-10-CM and ICD-10-PCS)
- Systemized Nomenclature of Medicine Clinical Terms (SNOMED CT)
- Defense Medical Information System Identifiers (DMIS ID)
- Service Connected, US Code, Title 38, Chapter 4 (updated)
- Breast Imaging Reporting and Data System (BIRADS)

Namespace LEX

We changed the namespace from GMPT to LEX. We renamed all routines and package variables from GMPT* to LEX* to conform to the new namespace.

Global Root ^LEX

We changed the global root from ^GMP and ^GMPT to ^LEX and ^LEXT respectively. This helps to prevent inadvertent deletion of Lexicon data. The difference between killing ^TMP and ^GMP is one character on a standard QWERTY keyboard, both controlled by the same
finger and located approximately a quarter of an inch from each other.

**Shortcut Functionality**  
Added

The Expression Type field (#757.01) has been changed from a set of codes to a pointer to the new file Expression Type, #757.011.

**Concept Usage File #757.001**  
Added

The Concept Usage file records the usage of Lexicon by application performing lookups using the Special Lookup Routines. This file later determines the order of the selection list during lookup. The more frequently used terms float to the top of the list.

**Expression Type File #757.011**  
Added

The Expression Type field (#757.01) has been changed from a set of codes to a pointer to the new file Expression Type, #757.011.

**Mapping Definitions File #757.31**  
Added

This file is used to define a mapping from one coding system (source code) to another coding system (target code). The coding systems are found in the Coding Systems file #757.03.

**Mappings File #757.32**  
Added

This file contains the mappings from one coding system to another coding system. Selection of a term or a code from one coding system can be translated to another coding system.

**Codes File #757.02**  
Changed

The Codes file was modified to include a status multiple to record code activation dates and inactivation dates. The ACT cross-reference is generated from this multiple. This cross reference provides the Lexicon the ability to retrieve the appropriate code and text based on a date supplied by the calling routine. If a date is not supplied, then TODAY is used.

**Coding Systems File #757.03**  
Changed

The Coding Systems file was modified by making the SOURCE TITLE field #2 an identifier for the purpose of lookup while editing the Change File #757.01. The IMPLEMENTATION DATE field #11 was added to document the implementation of each Coding System.

**Character Positions File #757.033**  
Added

This file stores the name/title, description, explanation, and inclusions/examples of a character position in a code.

**Subset Definition file #757.2**  
Changed

The DIC("S") value used by various applications and stored in the APPLICATION FILTER field (#10) has been modified to include the passing of a date.

**Shortcut User Default**  
Added

Context sensitive shortcuts are now a user default. For example, the user may have one set of shortcuts for searching using the Problem List application and another set defined for another
Silent Lookup Added
A Silent Lookup was added in support of GUI. The Lexicon Special Lookup routine has been modified to call the Silent Lookup so that the behavior of the loud lookup would be identical to the silent lookup. This lookup also includes:

- Reordering the selection list with the most frequently used at the top
- Placing the exact match at the top of the selection list

5. Lexicon Example Entry – Migraine Headache

5.1 Terms

| COSTART | Coding Symb Thesaurus - Adverse Reaction Terms | MIGRAINE |
| CRISP | CRISP Thesaurus, Nat Inst of Health | 2056-6472 |
| SNOMED D | Sys Nomen of Med, Diagnostic, 2nd Ed | D-8250 |
6. Package Components

6.1 Manager Options

6.1.1 Lexicon Management Menu

Defaults . . .

[LEX MGR DEFAULTS] Menu

This menu contains two options, one to modify user defaults and one to list user defaults.

Edit User/User Group Defaults LEXDMG

[LEX MGR USER DEFAULTS]

This option allows a manager to modify user defaults (filter, display, shortcuts, vocabulary) for either a single user or a group of users (based on service).

List User/User Group Defaults LEXDD1

[LEX MGR LIST DEFAULTS]

This option allows a manager to list user defaults to a device (filter, display, shortcuts, or vocabulary) for either a single user or a group of users (based on service). It also allows the manager to limit the listing to users with or without defaults.

Edit Lexicon . . .

[LEX MGR EDIT LEXICON] Menu

Very few fields in the Lexicon may be edited. This menu option contains two sub-options that allow managers to edit those [few] fields. One sub-option allows a manager to edit a term definition and the other to edit shortcuts (by context).

Edit Term Definition LEXEDF1

[LEX MGR EDIT DEFN]

This option lets you edit the definition of an expression. This definition is accessible during searches using the Lexicon help routine.

Edit Shortcuts by Context LEXSC

[LEX MGR EDIT SHORTCUTS]

This option lets managers add or delete shortcuts in a selected context.

Edit Search Threshold for a Coding System LEXDMGS

[LEX MGR EDIT SEARCH THRESHOLD]

This allows a manager to edit the search threshold for a coding system. That is the default number of record to examine before prompting the user to continue or refine the search.
6.2 User Manager/Options

Lexicon Utility Menu

[LEX UTILITY] Menu

This menu contains two sub-options, Look-up Term and User Defaults.

Look-up Term [LEX LOOK-UP]

This option lets you perform a simple lookup in the Lexicon and displays all the information known about the term selected.

User Defaults . . .

[LEX USER DEFAULTS] Menu

This menu contains five sub-options that let a single user modify or list user defaults, including the search filter, the display format, the preferred vocabulary, and shortcuts.

Filter [LEX USER FILTER]

This option lets the users either select or create their own filters to use while conducting searches in the Lexicon. The filter limits the response of the lookup based on the conditions found in the filter.

Display [LEX USER DISPLAY]

This option lets the user either select or create a display format which is used in presenting the selection list during searches in the Lexicon.

Vocabulary [LEX USER VOCABULARY]

This option lets the user select a default vocabulary (or subset of the Lexicon) to be used during a lookup (i.e., Nursing, Social Work, etc.).

Shortcuts [LEX USER SHORTCUTS]

This option lets the user select a default set of shortcuts to use to rapidly access the Lexicon without the benefit of the special lookup.

List Defaults [LEX USER DEFAULT LIST]

This option lets the user list the current defaults (by application) to a device (terminal or printer).
6.3 Code Set Versioning Options

Code Sets

[LEX CSV]  
ICD-9 Diagnosis Code Set Query  LEXQID  
[LEX CSV ICD QUERY]

This option displays a single versioned entry from the ICD Diagnosis file #80 based on a date provided by the user. The date may be a future date.

ICD-9 Procedure Code Set Query  LEXQIP  
[LEX CSV ICP QUERY]

This option displays a single versioned entry from the ICD Operations/Procedure file #80.1 based on a date provided by the user. The date may be a future date.

CPT/HCPCS Procedure Code Set Query  LEXQCP  
[LEX CSV CPT QUERY]

This option displays a single versioned entry from the CPT/HCPCS file #81 based on a date provided by the user. The date may be a future date.

CPT Modifier Code Set Query  LEXQCM  
[LEX CSV MOD QUERY]

This option displays a single versioned entry from the CPT Modifier file #81.3 based on a date provided by the user. The date may be a future date.

ICD/CPT Code Set Change List  LEXQC  
[LEX CSV ICD/CPT CHANGE LIST]

This option produces a listing of ICD/CPT changes effective on the date provided by the user.

Code History

[LEX CSV HISTORY]  LEXQH

This option produces a historical display of the versioned data for a selected code.

6.4 Protocols

6.4.1 Lexicon Update

[LEXICAL SERVICES UPDATE]  Extended Action

This Protocol is invoked by the Lexicon each time an update occurs with one of the coding systems that subscribe to this protocol. Currently there are two:

[ICD CODE UPDATE EVENT]
Applications that require to be notified each time there is an update to either ICD-9 or ICD-10 coding systems may place an action on the [ICPT CODE UPDATE EVENT] protocol. Applications that require to be notified each time there is an update to the CPT-4 coding system may place an action on the [ICPT CODE UPDATE EVENT] protocol.

6.4.2 Lexicon Update Notification (example)

LEXICAL SERVICES UPDATE
This protocol is invoked when a change to the ICD-9, ICD-10, CPT-4, or HCPCS coding system occurs.

ICD CODE UPDATE EVENT
This protocol is invoked when a change to the ICD-9 or ICD-10 coding systems occurs.

GMPL SELECTION LIST CSV EVENT
This Problem List protocol is invoked when a change to the ICD-9 coding system occurs. It reports any problems on the problem selection list that contains an inactive ICD-9 code.

ORCM GMRC CSV EVENT
This OERR/Consults protocol is invoked when a change to the ICD-9 coding system occurs. It reports any consult or procedure quick order with an inactive ICD-9 code.

PXRM CODE SET UPDATE ICD
This Clinical Reminder protocol is invoked when a change to the ICD-9 coding system occurs. It reports all inactive ICD-9 codes in the Dialog file #801.41.

ICPT CODE UPDATE EVENT
This protocol is invoked when a change to the CPT-4 or HCPCS coding system occurs.

PXRM CODE SET UPDATE CPT
This Clinical Reminder protocol is invoked when a change to the ICD-9 coding system occurs. It reports all inactive ICD-9 codes in the Clinical Reminders Dialog file #801.41.

2) = K ^LEX(757,"B",$E(X,1,30),DA)

^LEX(757,"B",MCE,IEN) - where MCE is a pointer to the expression in the Expression file #757.01 which represents a clinical Major Concept Expression, and IEN is the Internal Entry Number in the Major Concept Map file #757

You may also retrieve the on-line documentation for any single file listed below by entering a single file number at START WITH WHAT FILE: prompt and not entering a file number at the GO TO WHAT FILE: prompt. The following is a listing of file numbers and file names contained in the Lexicon Utility package:

8. Routines Supporting the Lexicon

8.1 Special Lookup

8.1.1 Description

Because of the requirement to reorder the list after the search and before user selection, this lookup now calls the Silent Lookup so that the search results from the Special Lookup and Silent Lookup remain consistent. The previous special lookup called the API to the Kernel Toolkit Multi-Term Lookup Utility (MTLU).

These routines are responsible for:

- Obtaining the user input search string and passing it to Silent Lookup, then prompting for and getting the user's response.
- Storing and mailing Unresolved Narratives. An Unresolved Narrative occurs when the lookup either does not find a match or when it finds a match but the user, not satisfied with the results, does not select an expression from the list. These Unresolved Narratives are rolled-up into a mail message and submitted for inclusion in later releases of the Lexicon.
- Returning the standard FileMan variables and one additional variable Y(1) containing an active ICD code when one exists.

8.2 Silent Lookup (New)

8.2.1 Routines

LEXA1  Lookup (user input/special lookup routine)
LEXA2  Selection
LEXA3  Display
LEXA4  Unresolved Narratives

8.2.2 Description

This lookup searches the Lexicon and responds by building global and local arrays.

8.2.3 Routines

Lookup

LEXA   Lookup
LEXASC  Lookup by Shortcuts
LEXAB  Exact Match B Index
LEXABC  Lookup by Codes
LEXALK  Lookup by Keywords
LEXAFIL  Lookup with Filter

Interpret User Response

LEXAR  Interpret User Response
LEXAR2  Up-arrow, Jump, Null
LEXAR3  Help, Definition, MAX, Refresh
LEXAR4  Select Entry
LEXAR5  Select Entry
LEXAR6  Unresolved Narratives
LEXAR7  MAIL Narratives

Miscellaneous
LEXAL  List Builder (Global)
LEXAL2  List Builder (Array)
LEXAM  Setup/Parse User Input
LEXASO  Get Classification Sources
LEXAS  Spell Check User Input
LEXAS2  Spell Check User Input
LEXAS3  Spell Check User Input
LEXAS4  Spell Check User Input
LEXAS5  Spell Check User Input
LEXAS6  Spell Check User Input
LEXAS7  Spell Check User Input

8.2.4 Setup
8.2.5 Routines
LEXMTLU  Set up for XTLKKWL API
LEXSET  Set up App/User for Lookup
LEXSET2  Set up App/User for Lookup
LEXSET3  Set up App/User for Lookup
LEXSET4  Set up Functions
LEXSET5  Set up App/User for Lookup

9. Setting/Displaying User Defaults

9.1 Description
Currently, there are only four (4) types of user defaults
- Vocabulary: The word index to use during the search.
- Display: A string of classification coding systems to display during the search.
- Filter: A condition for selecting terms based on semantic or classification systems.
- Shortcut Context: A set of keywords resulting in immediate return of an expression.

These routines allow users and managers to either select from pre-existing defined default values or create their own.

<table>
<thead>
<tr>
<th>Default</th>
<th>Select Default from a List</th>
<th>Create your own Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Display</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Shortcuts</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Vocabulary</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>
Additionally, managers may set defaults for multiple users based on service. Both users and managers may display user defaults. Users can only display their own defaults in a human readable format much like that shown in the section, “Controlling the View”. A manager may display the defaults for a single user or a user group, showing the actual data stored as the default values. Because of the complexity of the filtering by semantic classes and types (see Controlling the View), a large number of these routines (LEXDFL*) are devoted to the creation of these filtering strings.

### 9.2 Routines

**Manager**

- LEXDMG: Manager Options
- LEXDMGU: Select User/User Group
- LEXDMGV: Verify Selections
- LEXDMGS: Search Threshold
- LEXDMGO: Overwrite Existing Defaults
- LEXDMGT: Task to Modify Defaults

**Default Filter**

- LEXDFL: Default Filter
- LEXDFLS: Select a Filter
- LEXDFLC: Create a Filter
- LEXDFLT: Filter Type
- LEXDFST: Filter by Semantics
- LEXDFSBS: Filter/Exclude Classes/Types
- LEXDFSII: Include Semantic Classes/Types
- LEXDFSEP: Exclude Semantic Classes/Types
- LEXDFSO: Filter by Sources
- LEXDCCC: Create Filter by Source
- LEXDFSS: Filter by Sources and Semantics
10. **Edit**

**10.1 Description**

These routines provide managers at a site with the ability to edit the definition and the shortcuts associated with an expression. The definition is used as part of the Lexicon's help routines to assist in the selection of a term from a selection list. An edited definition is mailed to SLC IRMFO for review and
possible inclusion into a future release. The shortcuts are used to associate a keyword to a specific expression to rapidly access the Lexicon without engaging the look-up engine.

10.2 Routines

12.3 Miscellaneous

12.3.1 Routines
LEXCODE  Convert Code to IEN
LEXSRC   Convert IEN to Code
LEXSRC2  Check Status of a Code
LEXTRAN  Retrieve Data for Specific Codes or Texts
LEXTRAN1 Retrieve Designations and Mappings for Specific Codes
LEXTRAN3 Mapping/Subset Updates
13. Package Characteristics and Usage

13.1 Supported Callable Routines

The following routines are supported:

13.1.1 LEXSET

CONFIG^LEXSET(<App>,<Subset>,<Date>)       ICR 1609

This entry point sets up the lookup variables for searching the Lexicon. It is not necessary to use this entry point for either Special Lookup or Silent Lookup since this entry point is embedded in Silent Lookup. You should use this entry point when:

- A search is to be conducted using the Kernel Toolkit's Multi-Term Lookup Utility (MTLU).

- It is desirable for an application to control the user defaults for a given situation (for example, the application may require the return of an ICD code).

This entry point searches the Subset Definition file (#757.2) and retrieves the application defaults, the subset defaults, and user defaults. Then it merges the three sets of defaults into a single list of defaults based on the information it has retrieved. For instance, if the application has defined the Overwrite flag as true, then the application defaults have precedence over any user defaults found and the user defaults are ignored. If the global root is anything other than ^LEX(757.01, then the user defaults for vocabulary and filter are ignored while the user defaults for display and shortcuts are used.
Input

This is the application identification and may be in the form of a name (e.g., PROBLEM LIST), a namespace (e.g., GMPL) or a pointer (e.g., Internal Entry Number—IEN) from an application definition in the Subset Definition file (#757.2). The default value for this parameter, if it is not supplied, is one (1), pointing to the Lexicon application definition. This is the same as the Application input parameter for LOOK^LEXA. A list of appropriate application identifiers is found in the Subset Definition file #757.2 in the AN index. At the time of this writing it included:

<table>
<thead>
<tr>
<th>Application ID</th>
<th>Application or Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPT</td>
<td>CPT-4 Procedures</td>
</tr>
<tr>
<td>CHP</td>
<td>CPT-4 and HCPCS</td>
</tr>
<tr>
<td>DSM</td>
<td>Mental Health DSM-4</td>
</tr>
<tr>
<td>GMPL</td>
<td>Problem List</td>
</tr>
<tr>
<td>ICD</td>
<td>ICD-9-CM Diagnosis</td>
</tr>
<tr>
<td>10D</td>
<td>ICD-10 Diagnosis</td>
</tr>
<tr>
<td>10P</td>
<td>ICD-10 Procedures</td>
</tr>
<tr>
<td>LEX</td>
<td>Generic Lexicon Utility</td>
</tr>
<tr>
<td>PSN</td>
<td>Pharmacy (drug/form)</td>
</tr>
<tr>
<td>RA</td>
<td>Brest Imaging Rpt Data Sys BI-RADS</td>
</tr>
<tr>
<td>VAC</td>
<td>VA Frequently used Codes</td>
</tr>
</tbody>
</table>

This parameter represents the vocabulary subset to use during the search. This parameter is passed as a subset name (e.g., NURSING), or the subset mnemonic (e.g., NUR) or as a pointer to the Subset Definition file (#757.2). The default value for this parameter, if it is not supplied, is one (1) pointing to the main vocabulary (WRD subset) of the Lexicon located in file 757.01 and indexed by AWRD. This is the same as the Subset input parameter for LOOK^LEXA. A list of appropriate vocabulary subsets is found in the Subset Definition file #757.2 in the AA and AB indexes. At the time of this writing it included:

<table>
<thead>
<tr>
<th>Subset ID</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEN</td>
<td>Dental Terminology</td>
</tr>
<tr>
<td>IMM</td>
<td>Immunologic Terminology</td>
</tr>
<tr>
<td>NUR</td>
<td>Nursing Terminology</td>
</tr>
<tr>
<td>SOC</td>
<td>Social Work Terminology</td>
</tr>
<tr>
<td>WRD</td>
<td>General Use (default)</td>
</tr>
<tr>
<td>CPT</td>
<td>CPT Procedures</td>
</tr>
</tbody>
</table>
### Subset ID

<table>
<thead>
<tr>
<th>Subset ID</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSM</td>
<td>Mental Health DSM-IV</td>
</tr>
<tr>
<td>ICD</td>
<td>ICD-9-CM Diagnosis</td>
</tr>
<tr>
<td>10D</td>
<td>ICD-10-CM Diagnosis</td>
</tr>
<tr>
<td>10P</td>
<td>ICD-10-PCS Procedures</td>
</tr>
<tr>
<td>NIC</td>
<td>Nursing Interventions</td>
</tr>
<tr>
<td>PL1</td>
<td>Problem List #1 General</td>
</tr>
<tr>
<td>PL2</td>
<td>Problem List #2 ICD Diagnosis and Procedures</td>
</tr>
<tr>
<td>VAC</td>
<td>VA Frequently used codes (ICD, ICP, DSM, CPT)</td>
</tr>
</tbody>
</table>

This is a date in FileMan format used to return the code that is active on the date supplied. If the date is not passed, then TODAY is used.

### Output

If the variable LEXQ does not exist or is preset to 1, then the merged set of default values are placed in the global array ^TMP("LEXSCH",$J) as in the case of a standard DIC lookup or Silent Lookup. The following is a brief summary of the global array:

<table>
<thead>
<tr>
<th>Global Array Segment</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>^TMP(&quot;LEXSCH&quot;,$J,&quot;ADF&quot;,0)</td>
<td>Application Default Flag</td>
</tr>
<tr>
<td>^TMP(&quot;LEXSCH&quot;,$J,&quot;APP&quot;,0)</td>
<td>Application</td>
</tr>
<tr>
<td>^TMP(&quot;LEXSCH&quot;,$J,&quot;DIS&quot;,0)</td>
<td>Display</td>
</tr>
<tr>
<td>^TMP(&quot;LEXSCH&quot;,$J,&quot;FIL&quot;,0)</td>
<td>Filter</td>
</tr>
<tr>
<td>^TMP(&quot;LEXSCH&quot;,$J,&quot;FLN&quot;,0)</td>
<td>File Number</td>
</tr>
<tr>
<td>^TMP(&quot;LEXSCH&quot;,$J,&quot;GBL&quot;,0)</td>
<td>Global (DIC)</td>
</tr>
<tr>
<td>^TMP(&quot;LEXSCH&quot;,$J,&quot;IDX&quot;,0)</td>
<td>Index</td>
</tr>
<tr>
<td>^TMP(&quot;LEXSCH&quot;,$J,&quot;LEN&quot;,0)</td>
<td>List Length</td>
</tr>
<tr>
<td>^TMP(&quot;LEXSCH&quot;,$J,&quot;OVR&quot;,0)</td>
<td>Overwrite User Default Flag</td>
</tr>
<tr>
<td>^TMP(&quot;LEXSCH&quot;,$J,&quot;SCT&quot;,0)</td>
<td>Shortcuts</td>
</tr>
<tr>
<td>^TMP(&quot;LEXSCH&quot;,$J,&quot;SVC&quot;,0)</td>
<td>Service</td>
</tr>
<tr>
<td>^TMP(&quot;LEXSCH&quot;,$J,&quot;UNR&quot;,0)</td>
<td>Unresolved Narrative Flag</td>
</tr>
<tr>
<td>^TMP(&quot;LEXSCH&quot;,$J,&quot;USR&quot;,0)</td>
<td>User (DUZ)</td>
</tr>
<tr>
<td>^TMP(&quot;LEXSCH&quot;,$J,&quot;VOC&quot;,0)</td>
<td>Vocabulary</td>
</tr>
</tbody>
</table>

If the variable LEXQ=0, then you should define the variable X as the user input and the merged set of default values are set into the appropriate local variables for making a direct call to the MTLU via the entry point ^XTLKKWL. The following variables are returned:
<table>
<thead>
<tr>
<th>Variable</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>

LEXU

$$ICDONE^LEXU(<IEN>,<Date>)$$

ICR 1573

$$CPTONE^LEXU(<IEN>,<Date>)$$

ICR 1573

$$DSMONE^LEXU(<IEN>,<Date>)$$

ICR 1573

$$D10ONE^LEXU(<IEN>,<Date>)$$

ICR 5679

$$P10ONE^LEXU(<IEN>,<Date>)$$

ICR 5679

These entry points (extrinsic functions) allow an application to retrieve a single code for a given classification system (ICD-9, CPT-4, and DSM-IV) and for a given internal entry number (IEN).

**Input**

- **<IEN>**
  This is an Internal Entry Number from the Lexicon Expression file #757.01.

- **<Date>**
  This is a date in FileMan format used to return the code that is active on the date supplied. If the date is not passed, then TODAY is used.

**Output**

- **Code**
  A single classification code, if one is found, or null, if no code is found.

  - $$ICDONE$$: One ICD-9 Diagnosis Code
  - $$CPTONE$$: One CPT Procedure Code
  - $$CPCONE$$: One HCPCS Code
  - $$D10ONE$$: One ICD-10 Diagnosis Code
  - $$P10ONE$$: One ICD-10 Procedure Code
  - $$DSMONE$$: One DSM-IV Diagnosis Code

**$$DX^LEXU(<IEN>,<Date>)$$**

ICR 5679

This entry point is to be used as a screen Lexicon searches. It will screen out all terms not linked to either an ICD-9 or ICD-10 code. The code type (ICD-9 or ICD-10) is determined by date. If the date passed in is before the ICD-10 implementation date then it will screen on ICD-9 codes. If the date is on or after the ICD-10 implementation date then it will screen on ICD-10 codes.

**Input**

- **<IEN>**
  This is an internal entry number in the expression file #757.01. When performing FileMan lookups, set it to the variable +Y. (Required)

- **<Date>**
  This is the versioning date against which the codes found by the search will be compared in order to determine whether the code is active or inactive. Additionally, if the date passed is earlier than the ICD-10 implementation date then the screen will only consider ICD-9 codes. If the date is on or after the ICD-10 implementation date then the screen will only consider ICD-10 codes. If the date is not passed, then TODAY's date will be used. (Optional)

Assuming the variable <Date> is a valid FileMan format date:

Screen on ICD Diagnosis
S DIC("S")="I $$$DX^LEXU(+Y,<Date>)"

<Date> is before the ICD-10 implementation date then screen on ICD-9 Diagnosis
<Date> is on or after the ICD-10 implementation date, then screen on ICD-10 Diagnosis
If the date is not passed, then TODAY is used.

Output

$$DX$$

This is a Boolean value:

$$DX = \begin{align*} 
1 & \quad \text{TRUE} \quad \text{If the Lexicon entry is linked to an active ICD code of the type determined by date.} \\
0 & \quad \text{FALSE} \quad \text{If the Lexicon entry is not linked to an active ICD code of the type determined by date.}
\end{align*}$$

$$ONE^LEXU(<IEN>,<Date>,<SAB>)$$

ICR 5679

Returns a single code for a given internal entry number (IEN) for a specified date and source (coding system).

Input

$$<IEN>$$

Internal Entry Number in the Expression file ^LEX(757.01).

$$<Date>$$

This is a date in FileMan format used to check if a code is active or inactive on a specified date. If not supplied, it will default to TODAY.

$$<SAB>$$

Source, this is an internal entry number in file #757.03 or the 3 character source mnemonic (found on the ASAB cross-reference in file #757.03) or the SOURCE ABBREVIATION (.01 field in file #757.03).

Output

$$ONE$$

A single code belonging to the specified coding system by the source abbreviation that is active on the date provided and assigned to the expression indicated by the internal entry number (IEN).

$$ALL^LEXU(<IEN>,<Date>,<SAB>)$$

ICR 5679

Returns all codes for a given internal entry number (IEN) for a specified date and source (coding system).

Input

$$<IEN>$$

Internal Entry Number in the Expression file #757.01.
This is a date in FileMan format used to check if a code is active or inactive on a specified date. If not supplied, it will default to TODAY.

Source, this is an internal entry number in file #757.03 or the 3 character source mnemonic (found on the ASAB cross-reference in file #757.03) or the SOURCE ABBREVIATION (.01 field in file #757.03).

Output

A string of codes for the source provided (one or more) delineated by a semi-colon or null if no codes are found for the source.

This entry point (extrinsic function) allows an application to retrieve a series of ICD codes for a given internal entry number (IEN).

Input

This is an Internal Entry Number from the Lexicon Expression file #757.01.

Output

A string of ICD codes (one or more) delineated by a semi-colon or null if no codes are found.

Example

If Y=33677^Diabetic Neuropathies then the call $$ICD^LEXU(+Y) returns the string 250.60;357.2, containing the ICD code for Diabetes with Neurological Manifestations and the ICD code for Polyneuropathy in Diabetes.

This entry point (extrinsic function) returns the implementation date for a specified source.

Input

Source, this is an internal entry number in file #757.03 or the 3 character source mnemonic (found on the ASAB cross-reference in file #757.03) or the SOURCE ABBREVIATION (.01 field in file #757.03).

Output

The date that a coding system was implemented in VistA in FileMan format.
This entry point returns information about a coding system on file in the Coding System file #757.03.

**Input**

- **<Sys>**
  - Coding system identification system and can be in any of the following formats:
    - A nickname if one exist, i.e. HCPCS, DSM, NANDA, BIRADS
    - First three characters of source abbreviation (file #757.03, field .01)
    - Source Abbreviation (file #757.03, field .01), i.e., ICD, CPT, SCT
    - Nomenclature (file #757.03, field 1), i.e., ICD-9-CM, ICD-10-PCS
    - Type (only for ICD), i.e., "DIAG" or "PROC" (requires date)

- **<Date>**
  - Versioning date in FileMan format used to determine coding system if only the type is known (DIAG or PROC) and to determine the correct SDO version if one exists. If the date is not passed, then TODAY is used.

**Output**

- **$$CSYS**
  - A 13 piece caret (^) delimited string
    - 1 IEN
    - 2 SAB (3 character source abbreviation)
    - 3 Source Abbreviation (3-7 char) (#.01)
    - 4 Nomenclature (2-11 char) (#1)
    - 5 Source Title (2-52 char) (#2)
    - 6 Source (2-50 char) (#3)
    - 7 Entries (numeric) (#4)
    - 8 Unique Entries (numeric) (#5)
    - 9 Inactive Version (1-20 char) (#6)
    - 10 HL7 Coding System (2-40 char) (#7)
    - 11 SDO Version Date (date) (757.08 #.01)
    - 12 SDO Version Id (1-40 char) (757.08 #1)
    - 13 Implementation Date (date) (#11)

**$$HIST^LEXU(**<Code>,<Sys>,.ARY)**

This entry point returns a code’s activation history in an array passed by reference.
Input

<Code>  This is a classification code found in the CODES file #757.02. (Required)

<Sys>  This is a coding system found in the CODING SYSTEMS file #757.03. It can be in the form of a pointer, a source abbreviation, or the name of a coding nomenclature. (Required)

Input/Output

 ARY  This is an array of status effective dates and activation status passed by reference. (Required)

 ARY(0) = Number of Activation History
 ARY(<date>,<status>) = Comment

Status

  0  = Inactive
  1  = Active

 Comments include:

 Activated
 Inactivated
 Re-activated
 Revised
 Reused

Output

 $$HIST  This is the number of activation history entries found
 Or
 -1 ^ Error Message
$$\text{PERIOD}^\text{LEXU}(<\text{Code}>,<\text{Sys}>,.\text{ARY})$$  
ICR 5679

This entry point returns the activation periods (active from and to) of a code in an array passed by reference.

**Input**

- **<Code>**
  - This is a classification code found in the CODES file #757.02. (Required)

- **<Sys>**
  - This is a coding system found in the CODING SYSTEMS file #757.03. It can be in the form of a pointer, a source abbreviation, or the name of a coding nomenclature. (Required)

**Input/Output**

- **.ARY**
  - This is an array of activation periods (including active on date and inactive on date when inactive) passed by reference. (Required)

  ARY(0)  6 piece "^" delimited string

  1  Number of Activation Periods found
  2  Coding System (pointer to file 775.03)
  3  Coding System Abbreviation
  4  Coding System Nomenclature
  5  Coding System Full Name
  6  Coding System Source

  or

  #NAME?

  ARY(<Activation Date>) = 4 piece "^" delimited string

  1  Inactivation Date (conditional)

  2  Pointer to Expression file #757.01 for the code in piece #2 above (required)

  3  Variable Pointer IEN;Root of a national file (see below) Include when the code exist in an national file (conditional)

    CPT Procedure code     IEN;ICPT(
ICD Diagnosis code IEN;ICD9(
ICD Procedure code IEN;ICD0(

4  Short Description from the SDO file (CPT or ICD)

ARY(<Activation Date>,0) = Lexicon Expression

Output

$$PERIOD$$  This is the number of activation periods found:

Same as output variable ARY(0)

or

-1 ^ error message

$$NXSAB^LEXU(<SAB>,<Rev>)$$  ICR 5679

This API returns the next Source Abbreviation found in the CODING SYSTEMS file 757.03 using the ASAB cross-reference. It is the equivalent of $O(^LEX(757.03,"ASAB",SAB)).

Input

<SAB>  This is either a Source Abbreviation (SAB) from the .01 field of file 757.03 or null value to find the first SAB.

<Rev>  This is a reverse flag (optional). If set to 1 the API will find the next Source Abbreviation in the reverse order (aka, previous SAB).

Output

$$NXSAB$$  This is either the next Source Abbreviation (SAB) previous SAB (when reverse flag set to 1) or null if the input parameter SAB has no next SAB.
This entry point returns information about a code from a specified coding system. It is intended to be similar to ICDDATA^ICDXCODE except it is not limited to ICD coding systems.

**Input**

<Code>  This is a code found in file #757.02 (CODES file).

<Sys>  This is a pointer to the CODING SYSTEMS file #757.03 that identifies the coding system that CODE belongs to. It is important to specify the coding system because some codes overlap various coding systems.

<Date>  This is the date that will be used to determine the status of the code in the CODE input parameter. The status will either be Inactive or Active.

**Input/Output**

.ARY  This is the name of a local array passed by reference that will contain the output.

ARY()

Lexicon Data

ARY("LEX",1)  IEN ^ Preferred Term
ARY("LEX",2)  Status ^ Effective Date
ARY("LEX",3)  IEN ^ Major Concept Term
ARY("LEX",4)  IEN ^ Fully Specified Name
ARY("LEX",5)  Hierarchy (if it exists)
ARY("LEX",6,0)  Synonyms/Other Forms
ARY("LEX",6,1)  Synonym #1
ARY("LEX",6,n)  #n
ARY("LEX",7,0)  Semantic Map
ARY("LEX",7,1,1)  Class ^ Type (internal)
ARY("LEX",7,1,2)  Class ^ Type (external)
ARY("LEX",7,1,n)  #n
ARY("LEX",7,1,n)  #n
ARY("LEX",8)  Deactivated Concept Flag
Coding System Data

ARY("SYS",1) = IEN
ARY("SYS",2) = Short Name
ARY("SYS",3) = Age High
ARY("SYS",4) = Age Low
ARY("SYS",5) = Sex
ARY("SYS",6,0) = MDC/DRG Pairing
ARY("SYS",6,1,1) = MDC
ARY("SYS",6,1,2) = DRGs
ARY("SYS",6,n,1) = #n
ARY("SYS",6,n,2) = #n
ARY("SYS",7) = Complication/Comorbidity
ARY("SYS",8) = MDC13
ARY("SYS",9) = MDC24
ARY("SYS",10) = MDC24
ARY("SYS",11) = Unacceptable as Principal Dx
ARY("SYS",12) = Major O.R. Procedure
ARY("SYS",13) = Procedure Category
ARY("SYS",14,0) = Description
ARY("SYS",14,1) = Text 1
ARY("SYS",14,n) = #n

Each data element will be in the following format:

ARY(ID, SUB) = DATA
ARY(ID, SUB,"N") = NAME

Where

ID Identifier, may be:

LEX for Lexicon data
SYS for Coding System data

SUB Numeric Subscript
DATA  This may be:

A value if it applies and is found
Null if it applies but not found
N/A if it does not apply

NAME  This is the common name given to the data element

Example:

S X= $$\text{CSDATA}^\text{LEXU}("C18.6",30,3141010,.ARY)}$

X=1

ARY("LEX",1)="267081^\text{Malignant neoplasm of descending colon}"

ARY("SYS",14,0)=1
ARY("SYS",14,0,"N")="Description"
ARY("SYS",14,1)="MALIGNANT NEOPLASM OF DESCENDING COLON"

Output

\$\$CSDATA

This is a boolean value:

\$\$CSDATA = 1 TRUE If the API is successful (fully or partial)
\$\$CSDATA = 0 FALSE If the API is unsuccessful

or

-1 ^ error message
### $\$MAX^{LEXU}(\langle\text{Sys}\rangle)$

**Input**

- `<Sys>` (Required) This is a pointer to the CODING SYSTEM file #757.03.

**Output**

- `$\$MAX$` This is the value stored in the SEARCH THRESHOLD field #12 of the CODING SYSTEMS file 757.03. This value, along with the value of `$\$FREQ^{LEXU}$`, can be used to evaluate if a search should continue or be further refined.

- `$\$FREQ$` The maximum number or records to inspect during a search based on the input text string.

- `$\$MAX$` The maximum number of records to consider for a coding system before refining the search.

### $\$FREQ^{LEXU}(\langle\text{Text}\rangle)$

**Input**

- `<Text>` (Required) This is a text string intended as the input for a Lexicon search.

**Output**

- `$\$FREQ$` This is the maximum number of records that must be inspected during a Lexicon search to find matching entries for the input search text.

  If this number is too high, applications should consider re-prompting the user to either continue with the search or to further refine the search.

### $\$PAR^{LEXU}(\langle\text{Text}\rangle,.ARY)$

**Input**

- `<Text>` (Required) This is a text string intended as the input for a Lexicon search and will be parsed into words and placed in a local array.

- `.ARY` Local array, passed by reference

**Output**

- `$\$PAR$` This is the number of words parsed from the text.

- `ARY` This is a local array containing the words parsed from the input text. The words are arranged in the order they are found in the text; in alphabetical order; and in the order they are used in the Lexicon search (frequency order)

  Total words found

  `ARY(0)="#`
Words listed in the order they appear in the input variable

\[
\begin{align*}
\text{ARY}(1) &= \text{WORD}1 \\
\text{ARY}(n) &= \text{WORD}n
\end{align*}
\]

Words listed alphabetically with the frequency of occurrence

\[
\begin{align*}
\text{ARY}('B', \text{WORD}A) &= # \quad \text{(Frequency of Use)} \\
\text{ARY}('B', \text{WORD}B) &= #
\end{align*}
\]

Words listed in the frequency order (the order used by the search)

\[
\begin{align*}
\text{ARY}('L', 1) &= \text{SEARCHWORD}1 \\
\text{ARY}('L', n) &= \text{SEARCHWORD}n
\end{align*}
\]

Special Variables used by the parsing logic:

- **LEXIDX**
  - If this variable is set, the text will use the parsing logic used for setting cross-references. **This is the default method.**

- **LEXLOOK**
  - If this variable is set, the text will use the parsing logic used for setup up for a Lexicon search (lookup).

**$$\text{$CAT^\text{LEXU(<Code>)}$}$$**

This entry point returns the category for a ICD-10 Diagnosis code.

**Input**

- **<Code>**
  - This is an ICD-10 Diagnosis code or sub-category.

**Output**

- **$$\text{CAT}$$**
  - This is the category to which the code or sub-category belongs.

**$$\text{$RECENT(<SAB>)$}$$**

This API returns a boolean valued flag to indicate if the coding system identified by the source abbreviation has been recently updated with in a 90 day window (looking forward by 30 days and to the past by 60 days). This is to evaluate if a coding system was updated by a quarterly patch, and may be used to trigger an code set update protocol.

**Input**

- **<SAB>**
  - This is either a 3 character source abbreviation taken from the .01 field of the CODING SYSTEM file 757.03 or a pointer to the CODING SYSTEM file 757.03.
Output

$$\text{RECENT}$$
This is a boolean valued flag

1. Indicates the coding system has been recently updated by a quarterly update by looking 30 days into the future and 60 days into the past for a change made to the coding system

2. Indicates the coding system has NOT been recently updated by a quarterly patch

$$\text{RUPD(SAB)}$$
This API returns a date the coding system identified by the source abbreviation has been updated based on a recent date (TODAY+3). This is to evaluate if a coding system was updated by a quarterly patch, and may be used to trigger an code set update protocol.

Input

$$<\text{SAB}>$$
This is either a 3 character source abbreviation taken from the .01 field of the CODING SYSTEM file 757.03 or a pointer to the CODING SYSTEM file 757.03.

Output

$$\text{RUPD}$$
This is date found for the last update to a coding system based on a recent date (TODAY+30)

$$\text{LUPD(SAB,DATE)}$$
This API returns the last date the coding system identified by the source abbreviation has been updated based on the date supplied (optional). If no date is supplied, the last date will be returned.

Input

$$<\text{SAB}>$$
This is either a 3 character source abbreviation taken from the .01 field of the CODING SYSTEM file 757.03 or a pointer to the CODING SYSTEM file 757.03.

$$<\text{date}>$$
This is a date to use to retrieve the last update for a coding system (optional)

Output

$$\text{LUPD}$$
This is date found for the last update to a coding system based on a recent passed or the last date updated if a date is not passed.
13.2 LEXCODE

EN^LEXCODE(<Code>,<Date>)

This entry point allows an application to retrieve the internal entry numbers (IENs) and the text (as the FileMan Y variable) of the expressions associated with a classification code.

Input

<Code> (Required) Code taken from a classification system listed in Coding Systems file #757.03

<Date> (Optional) The date against which the codes found by the search will be compared in order to determine whether the code is active or inactive. If not passed, TODAY's date will be used.

Output

Local Array LEXS

LEXS(0)=Code
LEXS(SAB,0)=Number of Terms found for SAB
LEXS(SAB,0,"SAB")=Source Nomenclature^Name
LEXS(SAB,#)=IEN file 757.01^Display Text (term)

Example of returned array LEXS using code V62.4

LEXS(0)="V62.4"
LEXS("DS4",0)=1
LEXS("DS4",0,"SAB")="DSM-IV^Diagnostic & Statistical Manual of Mental Disorders"
LEXS("DS4",1)="303722^Acculturation Problem"
LEXS("ICD",0)=5
LEXS("ICD",0,"SAB")="ICD-9-CM^International Classification of Diseases, Diagnosis"
LEXS("ICD",1)="111638^Social maladjustment"
LEXS("ICD",2)="29696^Cultural Deprivation"
LEXS("ICD",3)="100676^Psychosocial Deprivation"
LEXS("ICD",4)="303722^Acculturation Problem"
LEXS("ICD",5)="111507^Social Behavior"

EXP^LEXCODE(<Code>,<Source>,<Date>)

This entry point allows an application to retrieve an active preferred term for a coding system on the date provided.

Input

<Code> (Required) Code taken from the Codes file #757.02.

<Source> (Required) This is either the three character Source Abbreviation or a pointer to the Coding Systems file #757.03. Source abbreviations (SAB) may be found in Appendix A or the “ASAB” cross-reference if the Coding Systems file #757.03. It is used to distinguish between different coding systems with the same code (i.e., the code 300.01
occurs in both the ICD-9-CM and DSM-IV coding systems).

<Date>  (Optional) The date against which the codes found by the search will be compared in order to determine whether the code is active or inactive. If not passed, TODAY's date will be used.

Output

$$EXP  2 Piece "^" delimited string containing

Either:

1  Pointer to Expression file #757.01
2  Display Text (Expression)

or:

1  -1 Error Message

13.3 LEX10CS  (ICD-10 Specific)

$$ICDSRCH^LEX10CS(<Text>,.ARY,<Date>,<Len>,<Fil>)   ICR 5681

This entry point searches for an ICD code and returns active ICD codes found up to the number defined by the input parameter Length. If the date is before the ICD-10 implementation date then the search will be conducted for ICD-9 codes. If the date passed is on or after the ICD-10 implementation date then the search will be conducted for ICD-10 codes.

Input

<Text>  Text or Code to search for. (Required)

.ARY  This is a local output array passed by reference. (Required)

<Date>  The date against which the codes found by the search will be compared in order to determine whether the code is active or inactive. If not passed, TODAY’s date will be used. (Optional)

<Len>  This specifies the length of the list of codes. Default value is 30. (Optional)

<Fil>  This is a filter to apply to the search to screen out unwanted entries. It is MUMPS code in the form of a valid IF statement. It is the same as FileMan's DIC("S"). (Optional)

Output

$$ICDSRCH  2 Piece "^" delimited string the success/error conditions
A Positive number for successful search
not exceeding the Length of the list.

A Negative number for an unsuccessful search
or a search condition

-1^No codes found

No codes found and local array not returned

-2^Too many items found, please refine search

The list exceeds the number indicated by the list length.
However, those found up to the list length will be returned in
the array and the list will be marked as a pruned list.

ARY
Output Array passed by reference containing the codes found

ARY(0)=# found ^ Pruning Indicator
ARY(1)=CODE ^ status effective date
ARY(1,"IDL")=ICD Dx long description (if code)
ARY(1,"IDL",1)=ICD Dx IEN ^ effective date
ARY(1,"IDS")=ICD Dx short description (if code)
ARY(1,"IDS",1)=ICD Dx IEN ^ effective date
ARY(1,"LEX")=Lexicon expression
ARY(1,"LEX",1)=Lexicon IEN ^ effective date
ARY(1,"SYN",1)=synonym #1
ARY(1,"SYN",m)=Synonym #m

Pruning Indicator: If the second piece of ARY(0) is greater than 0,
then the list has been pruned, limiting the list to the length specified
by the input parameter <Len>.
$$DIAGSRCH^LEX10CS(<Text>,.ARY,<Date>,<Len>,<Fil>)$$

ICR 5681

This entry point searches for an ICD code and returns active ICD-10 codes found up to the number defined by the input parameter Length. This search is similar to $$ICDSRCH^LEX10CS$$ except it searches only ICD-10 codes.

**Input**

- **<Text>**
  
  Text or Code to search for. It is the same as FileMan's X. (Required)

- **.ARY**
  
  This is a local output array passed by reference. (Required)

- **<Date>**
  
  The date against which the codes found by the search will be compared in order to determine whether the code is active or inactive. If not passed, TODAY's date will be used. (Optional)

- **<Len>**
  
  This specifies the length of the list of codes. (Optional)

- **<Fil>**
  
  This is a filter to apply to the search to screen out unwanted entries. It is MUMPS code in the form of a valid IF statement. It is the same as FileMan's DIC("S"). (Optional)

**Output**

- **$$DIAGSRCH$$**
  
  2 Piece "^" delimited string the success/error conditions

  A Positive number for successful search not exceeding the Length of the list.

  A Negative number for an unsuccessful search or a search condition

  -1^No codes found

  No codes found and local array not returned

  -2^Too many items found, please refine search

  The list exceeds the number indicated by list length. However, those found up to the list length will be returned in the array and the list will be marked as a pruned list.

- **ARY**
  
  Output Array passed by reference containing the codes found
Pruning Indicator: If the second piece of ARY(0) is greater than 0, then the list has been pruned, limiting the list to the length specified by the input parameter <Len>.

14. Pruning the Output

The DIAGSRCH API builds an array of terms linked to ICD-10 codes. This API employs a two-staged search as follows:

Stage 1: Initial Search

It first checks to see if the input text string is a code or partial code. If it is, then a "lookup by code" begins and all codes that equal or begin with the input text are placed in the array. If the input text is not a code, then a "lookup by text" begins and all terms found that are linked to an ICD-10 code are placed in the array.

Stage 2: Search Pruning

If the search list does not exceed a predefined number of matches (default if unspecified to be 30), then the list will be passed back to the calling application. If the search list exceeds a predefined number of matches, then the list will be pruned using ICD-10-CM categories/sub-categories.

The rightmost character of each code in the original list will be removed. If the resulting text is either a diagnosis category or a sub-category then the category or sub-category will be added to the list and the code will be removed (category replaces code on the list). If there is no category or sub-category the code will remain on the list.
The list length will be checked again. If the new list length is less than the limit then the list will passed back to the calling application. If the new list length is not less than the limit then the pruning continues, character by character, until number of items on the list fall below the limit.

For example, suppose the limit is set to 6 and the search returns the following codes:

- A12
- A12.0
- A12.45
- A12.46
- A13.49
- E13
- E13.31
- E14.45
- E14.567
- S34.203
- S34.204
- S34.205

The search returned 12 codes and exceeds the limit of 6, so search results will be pruned returning the following codes:

- A12
- A12.4
- A13.4
- E13
- E13.3
- E14.4
- E14.5
- E14.56
- S34.2

The pruned search returns 9 codes which still exceeds the limit of 6, so the pruning operation will be repeated until the limit does not exceed 6:

- A12
- A13
- E13
- E14
- E14.5
- S34.2

The additional pruning returns search results that is now equal to or less than the limit of 6. These categories/codes are placed in the array and returned to the calling application to present to the user. The calling application will issue all prompts and help text for user interaction.

$$PCSDIG^LEX10CS(<Frag>,<Date>)$$

This entry point takes an ICD-10-PCS code, full or a partial (code fragment), and returns a list of all possibilities for the next character, with any definitions and examples available. If a full code is passed (7 characters), it will return the code's long description and status.

**Input**

- **<Frag>**
  - This is an ICD-10-PCS Code (7 characters) or a fragment of an ICD-10-PCS Code (less that 7 characters). (Required)

- **<Date>**
  - The date against which the codes found by the search will be compared in order to determine whether the code is active or inactive. If not passed, TODAY's date will be used. (Optional)
### Output

**$$PCSDIG****This is a boolean value:**

- $$PCSDIG = 1$$ When the input code fragment is valid or null
- $$PCSDIG = 0$$ When the input code fragment is invalid

**LEXPCDAT** Output local array containing characters in the next position and the character descriptions.

If the input parameter `<Frag>` is a valid code fragment or null, the return value of LEXPCDAT will be 1 and the following array will be returned.

- LEXPCDAT("NEXLEV ,char1, DESC")=char1 description
- LEXPCDAT("NEXLEV ,char2, DESC")=char2 description
- LEXPCDAT("NEXLEV ,charn, DESC")=charn description

If the input parameter `<Frag>` is a valid code, the return value of LEXPCDAT will be 1 and the following array will be returned.

- LEXPCDAT("PCSDESC")=long description for code
- LEXPCDAT("STATUS")=status_ ^ _effective date

If the input parameter `<Frag>` is not a valid code fragment or null and it is not a valid code, the return value of LEXPCDAT will be 0 and no array will be returned.

### $\text{CODELIST}^\text{LEX10CS}$

**$\text{CODELIST}^\text{LEX10CS}(<\text{Sys}>, <\text{Spec}>, .ARY, <\text{Date}>, <\text{Len}>, <\text{Fmt}>)$** ICR 5681

This entry point creates a list of active codes based on an input code mask and date and places the list in an array specified by the calling application.

### Input

**<Sys>** Coding system from the Coding Systems file #757.03. This can be a pointer, the .01 field or the abbreviated 3 character mnemonic (found on the ASAB cross-reference). (Required)

**<Spec>** This is a code from the coding system or a code mask. Any character position can be occupied by a question mark “?” to allow any value in that character position. The trailing character may be an asterisk indicating any characters that follow are allowable. The following are all valid; C71.0, C71.*, C7?.0, or 02V?0*. (Required)
.ARY  This is a local output array passed by reference. (Required)

<Date>  The date against which the codes found by the search will be compared in order to determine whether the code is active or inactive. If not passed, TODAY's date will be used. (Optional)

<Len>  This specifies the length of the list of codes. Default value is 30. (Optional)

<Fmt>  List Format. A value of 1 returns a detailed listing in the array, includes the code, code IEN in file #757.02, the code's effective date, the expression, and the expression IEN in file #757.01. A value of 0 (zero) returns a brief listing in the array (codes only). Default value is 0 (zero). (Optional)

Output

$$CODELIST  2 Piece "^" delimited string containing

Either:

<table>
<thead>
<tr>
<th>Piece</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Positive value for success</td>
</tr>
<tr>
<td>2</td>
<td>Number of Codes Found</td>
</tr>
</tbody>
</table>

or:

<table>
<thead>
<tr>
<th>Piece</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Negative number for error or condition</td>
</tr>
<tr>
<td>2</td>
<td>Error Message or Condition</td>
</tr>
</tbody>
</table>

Example errors/conditions

-1  Coding system not specified (First parameter is missing)
-2  Invalid coding system/source abbreviation (First parameter not valid)
-3  No search specification (Second parameter missing)
-4  Insufficient search specification (Second parameter too short)
-5  Invalid search specification (Second parameter invalid)
-6  Number of matches exceeds specified limit (More matches found, only the number specified will be returned)

^TMP(SUB,$J,  This is a global array subscripted as specified by the calling application, input parameter SUB. It contains a list of codes found in either a brief or detailed output.
Brief output array (<Fmt> = 0)

^TMP(SUB,$J,0)=Total n
^TMP(SUB,$J,1)=Code 1
^TMP(SUB,$J,2)=Code 2
^TMP(SUB,$J,n)=Code n

Detailed output array (<Fmt> = 1)

^TMP(SUB,$J,0)=Total n
^TMP(SUB,$J,1)=Code 1
^TMP(SUB,$J,1,1)=Variable Pointer 1 ^ Code 1 ^ Date
^TMP(SUB,$J,1,2)=Expression 1 IEN ^ Expression 1
^TMP(SUB,$J,2)=Code 2
^TMP(SUB,$J,2,1)=Variable Pointer 2 ^ Code 2 ^ Date
^TMP(SUB,$J,2,2)=Expression 2 IEN ^ Expression 2
^TMP(SUB,$J,n)=Code n
^TMP(SUB,$J,n,1)=Variable Pointer n ^ Code n ^ Date
^TMP(SUB,$J,n,2)=Expression n IEN ^ Expression n

**Note:** If the code is found in one of the VistA Code Set files controlled by a Standards Development Organization (SDO), then a variable pointer will be provided for that code in that file. Example of SDO controlled files include:

- ICD DIAGNOSIS file #80
- ICD OPERATION/PROCEDURE file #80.1
- CPT file #81
- DSM file #627.7

$STAX^LEX10CS(<Text>,<Src>,<Date>,<Sub>,<Ver>) ICR 5681

This entry point searches the input text and build an array of codes that qualify for a taxonomy.

**Input**

- **<Text>** This is a text string, a code or a code fragment to search for. (Required)

- **<Src>** This is a string of sources delimited by an “^” up arrow. The sources may be either a pointer to the CODING SYSTEM file 757.03, or a source abbreviation (found in the ASAB cross reference of file 757.03) (Required)

  Using source pointers to file 757.03
  "1^2^30^31"

  Using source abbreviations
"ICD^ICP^10D^10P"

<Date>  
This a date used processing versioned data. Also, when a versioned list is required (input parameter VER=1) it is used to suppress inactive codes from the list. (Optional, default is TODAY)

<Sub>  
This is the name of a subscript to use in the ^TMP global (Optional). This allows for applications to put the data in their own namespace. It also allows for multiple search results to exist.

^TMP(LEXSUB,$J, ^TMP("LEXTAX",$J, Default

<Ver>  
This is a boolean flag that indicates if the search is to be versioned. If set to 1, only active codes will be returned based on the date in the <Date> input parameter. If no date, then TODAY is used. Default value is 0 (zero). (Optional)

0  Return active and inactive codes
1  Version, return active codes only

Output

$$TAX  
This the number of codes found by the search or -1 ^ with an error message.

^TMP(SUB,$J, This is the results of the search saved in the ^TMP global with the specified subscript arranged by source:

^TMP(SUB,$J,SRC,(CODE_ " " ),#)

5 piece "^" delimited string

1  Activation Date (can be a future date)
2  Inactivation Date (can be a future date)
3  Lexicon IEN to Expression File 757.01
4  Variable Pointer to a National file
5  Short Name from a National file

^TMP(SUB,$J,SRC,(CODE_ " " ),#,0)

2 piece "^" delimited string

1  Code (no spaces)
2  Lexicon Expression
14.1 LEX10CX  (ICD-10 Specific)

This entry point is an interactive lookup where the input coding system and code are not known. There is no input variables for this API, however, the variable LEXSAB can be preset to a coding system (.01 field in file 757.03), else wise the user will be prompted for a coding system. This API will display a selection list of suggested ICD-10 codes that have a similar textual content as the user selected code and coding system. If no suggestions are available or the user does not make a selection, then the user will be prompted for a ICD-10 code.

**Input**

None

**Output**

- **X**
  
  This is a 4 piece "^" delimited string representing the source code.
  
  1  Lexicon IEN for file 757.02
  2  Expression
  3  Code in selected Coding System
  4  Coding System nomenclature

  or null if search fails

Examples:

  X="119899^Tobacco Use Disorder^305.1^ICD-9-CM"
  X="7078519^Diabetes mellitus type 2^44054006^SNOMED CT"

- **Y**
  
  This is a 4 piece "^" delimited string representing the target ICD-10 code.
  
  1  Lexicon IEN for file 757.02
  2  Expression
  3  ICD-10 Diagnostic Code
  4  ICD-10-CM

  or -1 if search fails

Examples:

  Y="5003360^Nicotine Dependence, unspecified, Uncomplicated^F17.200^ICD-10-CM"
  Y="5002666^Type 2 Diabetes Mellitus without Complications^E11.9^ICD-10-CM"
EN2^LEX10CX(<Code>,<SAB>)

This entry point is an interactive lookup where the input coding system and code are known and supplied as input parameters CODE and SAB. This API will display a selection list of suggested ICD-10 codes that have a similar textual content as the specified code (CODE) and coding system (SAB). If no suggestions are available or the user does not make a selection, then the user will be prompted for an ICD-10 code. The output for EN2 is the same as entry point EN.

Input

<Code>  This is a code from the specified coding system identified by the input parameter SAB.
<SAB>   This is the coding system abbreviation (a three character representation of the coding system taken from the .01 field of the CODING SYSTEMS file 757.03)

Output

Same as EN^LEX10CX

EN3^LEX10CX(<Code>,<SAB>,.ARY,<Max>)

This entry point is a silent lookup for suggested ICD-10 codes for a code in another coding system. The code (CODE) and coding system abbreviation (SAB) are passed as input parameters. This API will create an array of suggested ICD-10 codes that have a similar textual content as the specified code (CODE) and coding system (SAB).

Input

<Code>  This is a code from the specified coding system identified by the input parameter SAB.
<SAB>   This is the coding system abbreviation (a three character representation of the coding system taken from the .01 field of the CODING SYSTEMS file 757.03)
ARY     This is a local array, passed by reference. This API kill the array before it starts to populate it. (see output variable ARY)
<Max>   This is the maximum number of suggestions to return in the array (optional, default 100)

Output

ARY     This is a local array, passed by reference:

ARY("X")  Input
ARY("Y",0) Output Number of Suggestions
ARY("Y",1) Output First Suggestion
ARY("Y",n) Output nth Suggestion
ARY("E")  Error Message

Both ARY("X") and ARY("Y",#) are 4 piece "^^"
delimited strings:

1  Internal Entry Number (IEN) file 757.01
2  Expression (file 757.01, field .01)
3  Code (file 757.02, field 1)
4  Nomenclature (file 757.03, field 1)
   i.e., SNOMED CT, ICD-9-CM or ICD-10-CM

Example:

ARY("X")="331786^Diabetes with Ketoacidosis, type I [Juvenile type], Uncontrolled^  
250.13^ICD-9-CM"
ARY("Y",0)=3
ARY("Y",1)="5002587^Type 1 Diabetes Mellitus with Ketoacidosis without Coma^  
E10.10^ICD-10-CM"
ARY("Y",2)="5002588^Type 1 Diabetes Mellitus with Ketoacidosis with Coma^  
E10.11^ICD-10-CM"
ARY("Y",3)="5002623^Type 1 Diabetes Mellitus with Hyperglycemia^E10.65^  
ICD-10-CM"

14.2 LEXSRC2

$$STATCHK^LEXSRC2(<Code>,<Date>,.ARY,<Src>)$$  ICR 4083

This entry point allows an application to retrieve the status of a code (active or inactive) and the effective  
date of the status. An optional array may be included to provide additional information about the code.

Input

<Code>  (Required) Code taken from the Codes file 757.02 (ICD/CPT/DSM  
       etc).
<Date>  (Optional) Date to screen against (default TODAY).
.ARY    (Optional) Output Array, passed by reference.
<Src>   (Optional) Source Abbreviation. Source abbreviations (SAB) may  
       be found in Appendix A or the ASAB cross-reference if the Coding  
       Systems file 757.03. It is used to distinguish between different coding  
       systems with the same code.

Output

$$STATCHK$$  2 or 3 Piece String containing the code's status, the IEN, and if the  
status exist, the effective date, else -1 in lieu of the IEN.

The following are possible outputs:

1 ^ IEN ^ Effective Date  Active Code
0 ^ IEN ^ Effective Date  Inactive Code
0 ^ IEN  Not Active
0 ^ -1  Code not Found

.ARY  (Optional) A local array (when passed by reference) containing the  
ASTM Triplet, the Major Concept Map and the Semantic Map.
ARY(0) Code, a 2 Piece String containing:
1 IEN in the CODES file #757.02
2 A Code (external)

ARY(1) Expression, a 2 Piece String containing:
1 IEN in the EXPRESSION file #757.01
2 The Code’s Expression (external)Code is Inactive, and not found in the Lexicon

ARY(2) Coding System, a 4 Piece String containing:
1 IEN in the CODING SYSTEMS file #757.03
2 Source Abbreviation (i.e., ICD or CPT)
3 Source Nomenclature (i.e., ICD-9-CM or CPT-4)
4 Source Full Name

ARY(3) Major Concept, a 3 Piece String containing:
1 IEN in the MAJOR CONCEPT MAP file #757
2 IEN in the EXPRESSIONS file #757.01
3 The Major Concept expression, which may be different from the code’s expression in ARY(1)

ARY(4,#) Semantics (multiple), a 5 Piece String:
1 IEN in the SEMANTIC MAP file #757.1
2 IEN in the SEMANTIC CLASS file #757.11
3 IEN in the SEMANTIC TYPE file #757.12
4 External Semantic Class
5 External Semantic Type

### 14.3 LEXTRAN

```
$CODE^LEXTRAN(<Code>,<Src>,<Date>,.ARY,<IENS>,<ID>,<INC>) ICR 4912
```

This API retrieves concept data for a given code and coding system.

**Input**

- **<Code>**
  This is a source code taken from one of the classification systems listed in Coding Systems file #757.03. e.g., ICD, CPT, DSM, NANDA, etc.

- **<Src>**
  This is a coding system identifier that identifies one of the coding systems listed in Coding Systems file #757.03. e.g., ICD, CPT, DSM, NANDA, etc.

- **<Date>**
  This is a date in FileMan format used to ensure that the expressions returned are for active codes on the date supplied. If the date is not passed, then TODAY is used.

- **<ARY>**
  This is the output array (defaults to LEX if none specified).
<IENS> Include expression IENs in output array (optional)
   1 return IENS (2nd piece)
   0 do not return IENS (default)

<ID>  Designation Identifiers (optional)
   1 return Designation IDs (3rd piece)
   0 do not return Designation IDs (default)

<INC> Include Deactivated Terms (optional)
   1 return Deactivated Terms
   0 do not return Deactivated Terms (default)

Output

$$CODE$$  If API finds an active code for the source
           "1^CODE"
           ARY - an array containing information about the code
           ARY(0) - a five piece string:
           1. code
           2. hierarchy
           3. version
           4. legacy code
           5. code status
           ARY("F") fully specified name
           ARY("P") preferred term
           ARY("S",n) synonyms (n is the nth synonym)

if call cannot find specified code on file
"-2"_NAME_ code _CODE_ not on file"
where NAME is the source name and
CODE is the code

if call finds an inactive code for the source
"-4"_NAME_ code _CODE_ not active for _DATE
ARY - an array containing information about the code
ARY(0) - a five piece string:
1. code
2. hierarchy
3. version
4. legacy code
5. code status

otherwise
"-1^error text"

eexample of ARY array:
This API retrieves concept data for a given designation and coding system.

**Input**
- **<Text>**: This is a designation.
- **<Date>**: This is a date in FileMan format used to ensure that the expressions returned are for active codes on the date supplied. If the date is not passed, then TODAY is used.
- **<Sub>**: This is a subset identifier. The subset specified must be one of the subsets defined in the subset definitions file (757.2).
- **<Src>**: This is a coding system identifier that identifies one of the coding systems listed in Coding Systems file #757.03. E.g., ICD, CPT, DSM, NANDA, etc.
- **<ARY>**: This is the output array (defaults to LEX if none specified).

**Output**
- **LEX** or passed array name - an array containing information about the code
  - LEX(0) - a five piece string:
    1. code
    2. hierarchy
    3. version
    4. legacy code
    5. code status
  - otherwise
    "-1\^error text"

example of LEX array:
- LEX(0)="67922002^Substance^20050701^T-C2500^1"
- LEX("F")="Serum (Substance)"
- LEX("P")="Serum"

This API retrieves version information for a given coding system and code.

**Input**
- **<Src>**: This is a coding system identifier that identifies one of the coding systems listed in Coding Systems file #757.03. E.g., ICD, CPT, DSM, NANDA, etc.
This is a source code taken from one of the classification systems listed in Coding Systems file #757.03. e.g., ICD, CPT, DSM, NANDA, etc.

This is a date in FileMan format used to ensure that the expressions returned are for active codes on the date supplied. If the date is not passed, then TODAY is used.

Output

```
$$VERSION
1^Version
or
-1^error message

TXT4CS^LEXTRAN(<Text>, <Src>,<ARY>, <Sub>) ICR 4914
```

This API determines whether a given designation is valid for a specified coding system.

Input

- `<Text>`: This is a designation.
- `<Src>`: This is a coding system identifier that identifies one of the coding systems listed in Coding Systems file #757.03. E.g., ICD, CPT, DSM, NANDA, etc.
- `<ARY>`: This is the output array (defaults to LEX if none specified).
- `<Sub>`: This is a subset identifier. The subset specified must be one of the subsets defined in the subset definitions file (#757.2).

Output

```
$$TXT4CS
1^number of finds
plus
LEX or passed array name - an array containing discovered concept IDs and expression type for finds, e.g. LEX(113912006)="MAJOR CONCEPT"
or
-1^error message
```

14.4 LEXTRAN1

```
$$GETSYN^LEXTRAN1(<Src>,<Code>,<Date>,ARY,<IEN>,<ID>,<INC>) ICR 5006
```

This API will return an array for a given code and coding system. The array will contain all synonyms for the concept including the preferred term and the fully specified name. If any of the parameters are incorrect or unrecognizable, the API will return an error message indicating the nature of the error.

Input

- `<Src>`: This is the mnemonic for a code system (mandatory). The allowable code system mnemonics are those that exist in the "B" index of the coding systems file (#757.03) This is code system source abbreviation Lexicon.
- `<Code>`: This is a code of a classification system that is stored in the Lexicon. Classification systems include SNOMED CT, ICD, CPT, HCPCS, etc.
<Date>  
This is the effective date; the default if no date is specified is the current system date (optional).

<IEN>  
If this parameter is set to 1 the expression IEN will be included in the return array. Default is 0 - exclude IENS from return array.

<ID>  
Designation Identifiers (optional)  
  1 return Designation IDs (3rd piece)  
  0 do not return Designation IDs (default)

<INC>  
Include Deactivated Terms (optional)  
  1 return Deactivated Terms  
  0 do not return Deactivated Terms (default)

Input/Output

ARY  
This is the name of the output array. The default, if no array name is specified, is 'LEX' (optional)

The format of the output is as follows:  
If valid code and source are passed  
  1^no of synonyms  
  LEX("P") = preferred term or major concept name^IEN  
  LEX("F") = fully specified name^IEN (if one exists)  
  LEX("S",n) = the nth synonym found^IEN (if they exist)

The presence of IEN in the return array is determined by the <IEN> parameter.

If the call does not find the code for the specified source it will return "-2"^_NAME_" code "_CODE_" not on file" where NAME is the source name CODE is the code.

If an invalid source is passed the call will return "-1^source not recognized"

$$GETFSN^LEXTRAN1(<Src>,<Code>,<Date>)$$  
ICR 5007

This API returns the fully specified name for a given coding system and code. If any of the passed parameters are incorrect or unrecognizable, the API will return an error message indicating the nature of the error.

Input

<Src>  
This is the mnemonic for a coding system (mandatory). The allowable code system mnemonics are those that exist in the "B" index of the coding systems file (#757.03) This is code system source abbreviation Lexicon.

<Code>  
This is a code that belongs to a coding system that is stored in the Lexicon. Coding systems include SNOMED CT, ICD, CPT, HCPCS, etc.

<Date>  
This is the effective date; the default if no date is specified is the current system date (optional).
current system date (optional).

Output

$$GETFSN$$

If the API finds an active code for the source

1^FSN

where FSN is the fully specified name

or

If the API cannot find specified code on file

-8^_NAME_" code "_CODE_" has no FSN"

where NAME is the source name and CODE is the code

or

-1 ^ error message

$$GETPREF$$

This API returns the preferred term for a given coding system and code. If any of the parameters are incorrect or unrecognizable, the API will return an error message indicating the nature of the error.

Input

<Src>

This is the mnemonic for a code system (mandatory). The allowable code system mnemonics are those that exist in the "B" index of the coding systems file (#757.03). This is the Lexicon code system source abbreviation.

<Code>

This is a code belonging to a coding system that is stored in the Lexicon. Coding systems include SNOMED CT, ICD-9-CM, CPT, HCPCS, etc.

<Date>

This is the effective date; the default if no date is specified is the current system date (optional).

Output

$$GETPREF$$

If call finds an active code for the source

1^PREF

where PREF is the preferred name

or

If call cannot find specified code on file

-2^_NAME_" code "_CODE_" not on file"

where NAME is the source name and CODE is the code

or

-1 ^ error message
$$\text{GETDES}^\text{LEXTRAN1}(\text{<Src>},\text{<Text>},\text{<Date>})$$  

**Input**

- **<Src>** This is the mnemonic for a code system (mandatory). The allowable code system mnemonics are those that exist in the "B" index of the coding systems file (#757.03). This is the Lexicon code system source abbreviation.

- **<Text>** This is the displayable text of the expression for which the designation code is being sought (mandatory).

- **<Date>** This is the effective date; the default if no date is specified is the current system date (optional).

**Output**

$$\text{GETDES}$$  

If call finds an active code for the source

\[ 1^\text{DESIG} \]

where DESIG is the designation code

or

If call cannot find specified code on file

\[ -2^\text{NAME}_"\text{" code "_CODE_" not on file} \]

where NAME is the source name and CODE is the code.

or

\[ -1^\text{ error message} \]

$$\text{GETASSN}^\text{LEXTRAN1}(\text{<Code>},\text{<Map>},\text{<Date>},\text{ARY})$$  

This API returns an array containing the mappings for a specified code for a specified mapping identifier. If any of the parameters are incorrect or unrecognizable, the API will return an error message indicating the nature of the error.

**Input**

- **<Code>** This is a code belonging to a coding system that is stored in the Lexicon. Coding systems include SNOMED CT, ICD, CPT, HCPCS, etc.

- **<Map>** This is the mapping identifier (mandatory). This allows the system to determine which map is to be used for translation. The map must be defined in the mapping definition file (#757.32).

- **<Date>** This is a code belonging to a coding system that is stored in the Lexicon. Coding systems include SNOMED CT, ICD, CPT, HCPCS, etc.

**Input/Output**
ARY

This is the name of the output array. The default, if no array name is specified, is 'LEX' (optional) the output array will have the following format:

\[
\text{LEX}(n,\text{CODE}) = ''
\]

where \( n \) is the nth mapped code

\( \text{CODE} \) is the code which is mapped to

e.g.

\[
>S \ V = $$\text{GETASSN}(15250008, \"SCT2ICD\")$
\]

\[
\text{LEX} = 2
\]

\[
\text{LEX}(1, \"371.30\") = ''
\]

\[
\text{LEX}(2, \"371.40\") = ''
\]

which shows that SNOEMD CT code 15250008 is mapped to two ICD-9-CM codes.

If the API finds no active mappings for passed arguments

\[
0^0
\]

If a bad argument is passed for a parameter, then the API returns

\#NAME?

If the API cannot find specified code on file

\[
-2^\_\text{Name}\_\" \text{CODE}_\" \text{not on file}"
\]

where NAME is the source name and CODE is the code

---

14.5 LEXXM

\[ $$\text{MIX}^\text{LEXXM}(\text{<Text>}) $$ \]

ICR 5781

This entry point converts any text to a modified mix case.

**Input**

\[ \text{<Text>} \]

This is a string of text in any case possible.

**Output**

\[ $$\text{MIX} $$

This is the same text, in a modified mix case.
Example:

arthropathy in behcet's syndrome involving other specified sites

Traditional Mixed Case (FileMan):

Arthropathy In Behcet's Syndrome Involving Other Specified Sites

Lexicon Modified Mixed Case ($$MIX^LEXXM)$:

Arthropathy in Behcet's Syndrome involving other specified sites

14.6 LEXA

INFO^LEXA(<IEN>,<Date>) ICR 1597

This entry point allows an application to build the LEX("SEL") selection array for any term in the Lexicon based on the internal entry number from the Expression file (#757.01). This entry point is meant to be used outside of the Lexicon lookup. It allows the application to retrieve information pertaining to the term to include synonyms, lexical variants, definitions, classification codes, semantic class and type, and linkages to the major VA classification files (e.g., ICD, CPT, DSM).

Input

<IEN> This is an Internal Entry Number from the Lexicon Expression file #757.01.
<Date> This is a date in FileMan format used to control which classification codes are returned based on the date supplied. If the date is not passed, then TODAY is used. Only active codes are returned.

Output

LEX("SEL") Local array LEX("SEL") containing the following segments:

<table>
<thead>
<tr>
<th>Array Segment</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>LEX(&quot;SEL&quot;,&quot;EXP&quot;)</td>
<td>Expressions</td>
</tr>
<tr>
<td>LEX(&quot;SEL&quot;,&quot;SIG&quot;)</td>
<td>Definitions when one exists</td>
</tr>
<tr>
<td>LEX(&quot;SEL&quot;,&quot;SRC&quot;)</td>
<td>Sources (classification codes)</td>
</tr>
<tr>
<td>LEX(&quot;SEL&quot;,&quot;STY&quot;)</td>
<td>Semantic Class and Type</td>
</tr>
<tr>
<td>LEX(&quot;SEL&quot;,&quot;VAS&quot;)</td>
<td>VA Sources</td>
</tr>
</tbody>
</table>

The LEX("SEL") array and all of its segments are described in the section titled Special Variables under the subheading Local Arrays.

LOOK^LEXA(<X>,<App>,<Len>,<Sub>,<Date>) ICR 2950

This entry point is silent and intended to support Graphical User Interface (GUI) development.
Input

<X>

Equivalent to FileMan's variable X and contains the text to search for.

<App>

This is the application identification and may be in the form of a name, namespace, or a pointer (Internal Entry Number - IEN) from an application definition in the Subset Definition file (#757.2).

The default value for this parameter, if it is not supplied, is one (1), pointing to the Lexicon application definition.

Included in this application definition are a number of application defaults which assist in searching the Lexicon. Application defaults include the global root, index, filter, display format, vocabulary, shortcuts, user default flag, overwrite user default flag, and the unresolved narrative flag. These are described in the Special Variable section of this manual.

At the time of this writing, there are six (6) application definitions:

<table>
<thead>
<tr>
<th>Name</th>
<th>Namespace</th>
<th>IEN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lexicon</td>
<td>LEX</td>
<td>1</td>
</tr>
<tr>
<td>Problem List</td>
<td>GMPL</td>
<td>4</td>
</tr>
<tr>
<td>ICD Diagnosis</td>
<td>ICD</td>
<td>12</td>
</tr>
<tr>
<td>CPT Procedures</td>
<td>CPT</td>
<td>13</td>
</tr>
<tr>
<td>Mental Health</td>
<td>DSM</td>
<td>14</td>
</tr>
<tr>
<td>ICD, CPT, and DSM Terminology</td>
<td>VAC</td>
<td>15</td>
</tr>
</tbody>
</table>

To conduct a search of the Lexicon using the application defaults for the Problem List, you may pass this parameter as:

Name "PROBLEM LIST" - This form is not case sensitive, and can be found in either the "B" or "C" index of file #757.2.

Namespace "GMPL" - Namespace - This form is not case sensitive, and can be found in the "AN" index of file #757.2.

Pointer 4 - This form is numeric, and is an Internal Entry Number (IEN) of file #757.2.

<Len> This is a numeric value which controls the returning list length in the local array LEX("LIST"). See the section Building/Re-ordering the List for how this variable is used. The default value for this parameter when not supplied is five (5).

<Sub> This parameter represents the vocabulary subset to use during the search. These subsets are defined in the Subset Definition file (#757.2). This parameter may be in one of three forms. To use the Nursing subset, you may pass the parameter as:

Name NURSING - This form is not case sensitive and may
be found in either the B or C index of file #757.2.

Mnemonic  NUR - This form is not case sensitive. The mnemonic may be found in either the AA* or AB index of file #757.2.

Pointer    2 - This form is numeric, and it is an Internal Entry Number (IEN) of file #757.2.

<Date>    This date is used to return the appropriate coding and classification information with the expression found during the search. The default value for this parameter is TODAY.

Lookup by Code - When the user searches the Lexicon for a specific classification code (i.e., ICD, CPT etc.), the date will be used to return the expression of the code that was active on the date supplied.

Lookup by Expression (text) - When the list of possible expressions is presented to the user for selection, codes displayed with the expressions include only those codes that were active on the date supplied.

Output

Full descriptions of the global and local arrays may be found in the section on Special Variables.

^TMP("LEXFND","J",<freq>,<IEN>)
This global array contains all of the entries found during the search. The <freq> is a negative number based on the frequency of use for a given term. IEN is the internal entry number in the Lexicon Expression File (#757.01).

^TMP("LEXHIT","J",<seq>)
This global array contains the entries reviewed by the user. The Lexicon Utility reorders the list based on frequency of use and assigns a sequence number representing where on the list this entry is located.

LEX("LIST")
This local array contains only those entries on the list which are currently being reviewed by the user. The third parameter to the look-up defines the length of this list.

14.7 LEXAR

EN^LEXAR(<Response >,<Date>)

<Date>    This date is used to return the appropriate coding and classification information with the expression found during the search. This parameter only comes into play when the <Response> from the user
is a number where the user is selecting an expression from the list.

14.7.1 User Responses

<table>
<thead>
<tr>
<th>User Response</th>
<th>Action</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>Null</td>
<td>PGDN</td>
<td>A null response has the effect of advancing the list by the number of entries defined by the third input parameter of the lookup.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1. If a null response is received from the user and the user is not at the end of the list, then the next # of entries is placed on the list in the local array.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2. If a null response is received from the user and the user is at the end of the list, then the list is killed and the dialog with the user is considered over. If the application uses the Unresolved Narratives the user narrative may be returned as the user's response to save the narrative in the Unresolved Narrative file (#757.06).</td>
</tr>
<tr>
<td>^</td>
<td>QUIT</td>
<td>Ends the dialog with the user by quitting the selection process, killing the selection list and setting LEX=0</td>
</tr>
<tr>
<td>^</td>
<td>EXIT</td>
<td>Ends the dialog with the application and kills all LEX namespaced variables.</td>
</tr>
<tr>
<td>^#</td>
<td>JUMP</td>
<td>An up-arrow followed by a numeric value where the number is a specified entry on the list allows the user to jump from one location on the list to another.</td>
</tr>

</tr>
<tr>
<td></td>
<td>LEX(&quot;SEL&quot;,&quot;SIG&quot;,0)=&lt;definition&gt;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>LEX(&quot;SEL&quot;,&quot;SIG&quot;,#)=&lt;definition text&gt;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>LEX(&quot;SEL&quot;,&quot;SRC&quot;,0)=&lt;sources&gt;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>LEX(&quot;SEL&quot;,&quot;SRC&quot;,#)=&lt;source^code&gt;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>LEX(&quot;SEL&quot;,&quot;VAS&quot;,0)=&lt;VA sources&gt;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>LEX(&quot;SEL&quot;,&quot;VAS&quot;,#)=&lt;file^VP^code^IEN&gt;</td>
<td></td>
</tr>
</tbody>
</table>

If a date is passed, then the sources listed in the LEX("SEL","SRC") array will contain active codes based on the date provided. If no date is passed, only active codes for TODAY will be listed.

User Input | Unresolved Narrative | If the list does not exist (in the case of receiving a null response at the end of the list), and the application uses unresolved narratives, and the user's original input string to the lookup is returned to the Lexicon, then the user's input and pertinent information about the search are saved in the Unresolved Narrative file (#757.06).

14.7.2 Application Comment

<table>
<thead>
<tr>
<th>Application Comment</th>
<th>Action</th>
</tr>
</thead>
</table>
| IEN^"Comment"      | This is a special case of this entry point (similar to the use of Unresolved Narratives), and can only be used outside of the Lexicon Lookup (i.e. LEX does not exist). This response to this entry point allows an application to comment on an actual term contained in the Lexicon, save this comment in the Unresolved Narratives file (#757.06), and have that comment returned to the developers along with the user's unresolved narratives. This special case is left up to the discretion of the calling application developers. Examples of application comments might be:
  * IEN^Diagnostic term maps to 799.9
  * This type of comment might be used by an application that requires a valid ICD with a diagnostic term (as is the case with Problem List). If the Lexicon returns the term without an ICD or with an ICD code not found in the ICD-9 file (#80), then the application could take advantage of this entry point to instruct the developers of the Lexicon to have Medical Records Technicians take a look at the term and evaluate the term to an appropriate ICD code for future iterations of the Lexicon.
  * IEN^RBBB suggested shortcut - Right bundle branch block
  * This type of comment might be used when the user input RBBB fails to
return a selection list, and on a subsequent search the user entered
bundle branch block and selected Right bundle branch block, implying
that RBBB was intended to have found “Right bundle branch block.”

15. Other Supporting Package Components

15.1 LEXD* Namespaced Routines

15.1.1 EN1^LEXD*(<Application>)
This is a series of callable routines established for the expressed purpose of setting user defaults for a
given application and intended for applications to create options to change the user lookup defaults for
that application. All of these routines assume DUZ is set to the current user. Two conditions must be met
for these routines to be used:

1. The application indicated by the input parameter has an application definition in the Subset
   Definition file (#757.2).
2. The application definition permits user defaults (Application User Defaults flag in file #757.2 is
   set to 1).

Input

<Application>
This is the application identification and may be in the form of a name
(i.e., PROBLEM LIST”, a namespace (i.e., GMPL) or a pointer (Internal
Entry Number - IEN) from an application definition in the Subset
Definition file (#757.2). The default value for this parameter, if not
supplied, is one (1), pointing to the Lexicon application definition. This is
the same as the Application input parameter for LOOK^LEXA.

EN1^LEXDFL(<Application>)  ICR 1599
This entry point allows a user to select or create a default filter for the
application identified by the input parameter application.

EN1^LEXDCC(<Application>)  ICR 1601
This entry point allows a user to select or create a default display for the
application identified by the input parameter application.

EN1^LEXDVO(<Application>)  ICR 1603
This entry point allows a user to select a default vocabulary for the
application identified by the input parameter application.

EN1^LEXDCX(<Application>)  ICR 1605
This entry point allows a user to select a set of shortcuts (based on
context) for the application identified by the input parameter application.
15.2 Special Variables

15.2.1 Variables Affecting the Lookup

LEXLL

This variable is taken from the third parameter to the entry point LOOK^LEXA and is a numeric value and controls the returning list length in the local array LEX("LIST").

LEXSUB

This variable is taken from the fourth parameter to the entry point LOOK^LEXA and the second input parameter to the entry point CONFIG^LEXSET. It represents the vocabulary subset to use during the search. This subset is indexed at either the AA or AB index of the Subset Definition file (#757.2). This parameter may be in one of three forms:

For example, to use the Nursing subset you may pass the parameter as:

<table>
<thead>
<tr>
<th>Name</th>
<th>NURSING</th>
<th>The name is found in either the B or C index of file #757.2.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mnemonic</td>
<td>NUR</td>
<td>The mnemonic is found in either the AA or AB index of file #757.2.</td>
</tr>
<tr>
<td>Pointer</td>
<td>2</td>
<td>This is an Internal Entry Number (IEN) of file #757.2.</td>
</tr>
</tbody>
</table>

LEXQ

This variable is used to tell the setup routine CONFIG^LEXSET which type of search variable to return:

LEXQ=1

Returns search variables for the silent lookup LOOK^LEXA (version 2+) and the loud lookup ^LEXA1 (version 2+) which is called by ^DIC and uses silent calls. These search variables are placed in the global array ^TMP("LEXSCH",$J). The default for LEXQ when it does not exist is 1.

LEXQ=0

Returns the search variables for the loud lookup using the Kernel Toolkit's Multi-Term Lookup Utility (MTLU) entry point ^XTLKKWL (Version 1.0).

**NOTE:** X must be preset to the user input prior to calling CONFIG^LEXSET with LEXQ=0.

LEX

This variable indicates the current status of the dialog between the Lexicon and either the user or the calling application.

LEX > 0

The lookup is still engaged, the selection list stored at ^TMP("LEXHIT") still exists, and the lookup is waiting for a user response.

LEX = 0

The lookup has disengaged, the selection lists stored at ^TMP("LEXHIT") and ^TMP("LEXFND") have been deleted, and the lookup is waiting for a
response from the application. There are only two conditions that can set LEX to 0. They are:

a. The user has reviewed the entire selection list and not made a selection. If this is the case, the global array ^TMP("LEXSCH",$J) still exists. At this point, the Lexicon is waiting to receive either the user narrative (to be saved in the Unresolved Narratives file #757.06) or any other response to proceed with cleaning up the environment before disengaging the dialog with the application.

b. The user has made a selection from the list. If this is the case, the local array LEX("SEL") is present. The Lexicon considers the dialog with the application over, and leaves the cleanup of the environment to the calling application (by killing LEX).

LEX does not exist.

This condition occurs when:

a. The user's input to LOOK^LEXA is null or contains an up-arrow (^) ending the dialog between the application and the Lexicon.

b. The user's response while reviewing the list contains double up-arrows (^\^) ending the dialog between the user and the Lexicon.

LEXVDT

This is a package wide variable and is taken from the fifth parameter to the entry point LOOK^LEXA and is the date (FileMan format) to use to find active codes and terms based on the given date. If not passed, TODAY is used. This date is used also by several other APIs related to data lookup and extraction. As a general guideline, this date should be either the date that service was provided to patient or the date that the term or code is used. This variable is also used in the FileMan (loud) lookup and can be set prior to calling ^DIC. After calling LOOK^LEXA, this variable will remain in the environment. The calling application are responsible for NEWing or KILLing this variable after the lookup.

15.2.2 Global Arrays

Found Array  ^TMP("LEXFND")

This global array contains the list of expressions found during the search. This global array continually grows smaller as ^TMP("LEXHIT") grows larger.

Hit Array  ^TMP("LEXHIT")

This global array contains the list of expressions found during the search. It is built by reordering the list in ^TMP("LEXFND") as the user reviews the list. The exact match (if any) at the top of the list, is immediately followed by other expressions found in the order of frequency of use. This array grows larger as the user reviews the list by adding entries to the list from ^TMP("LEXFND"). It is deleted when the Lexicon disengages the dialog with the user (the user either entered an up-arrow ^ or has reviewed the entire list and did not make a selection).

15.2.3 Search Conditions
<table>

</tbody>
</table>

### 15.2.4 Local Arrays

There is only one local array, LEX. It contains the following segments:

<table>
<thead>
<tr>
<th>LEX(&quot;ERR&quot;,&quot;#&quot;)</th>
<th>Errors</th>
</tr>
</thead>
<tbody>
<tr>
<td>LEX(&quot;EXC&quot;)</td>
<td>Location of an Exact Match Major Concept</td>
</tr>
<tr>
<td>LEX(&quot;EXM&quot;)</td>
<td>Location of an Exact Match Major Concept</td>
</tr>
<tr>
<td>LEX(&quot;HLP&quot;,&quot;#&quot;)</td>
<td>Help Text to Display</td>
</tr>
<tr>
<td>LEX(&quot;LIST&quot;,&quot;#&quot;)</td>
<td>Selection List to Display</td>
</tr>
<tr>
<td>LEX(&quot;NAR&quot;)</td>
<td>User Narrative</td>
</tr>
<tr>
<td>LEX(&quot;MAT&quot;)</td>
<td>Matches Found String</td>
</tr>
</tbody>
</table>
### 15.2.5 Error Array

| LEX("MAX") | The Maximum allowable Selection |
| LEX("MIN") | The minimum allowable Selection |
| LEX("RES") | Last Response from the User |
| LEX("UNR") | Unresolved Narrative flag |
| LEX("SEL",SEG,#) | The Results of a User Selection |

LEX("ERR")

This segment only exists if an exact match is found during the lookup. It provides the location where the exact match is stored. There are two forms of this segment:

1. The list still exists and the user is reviewing the entries on the list for selection:

   LEX("EXM")=<position on the list>^<term>

   In this case, the position on the list is set to 1 (exact matches are placed on the top of the selection list). A calling application could use the position on the list (the first piece) as a default value (formerly DIC("B")) when offering the user a choice.

   22 matches found
   1. Exact match
   2. Exact match Major Concept - see LEX("EXC") below
   3. Other match
   4. Yet another match
   5. ....

   Select 1-5: 1/

2. The list no longer exists because the user has either made a selection from the entries on the list or has reviewed all the entries on the list without making a selection:

   LEX("EXM")=<IEN>^<term>

   In this case, the position on the list has been replaced with the internal entry number in the Lexicon Expression file (757.01) and remains available for further use (i.e., Unresolved Narratives).

### 15.2.6 Exact Match Concept

LEX("EXC")

This segment only exists if an exact match is found during the lookup (see EXM above) and the exact match is not a Major Concept (i.e., synonym or lexical variant to a Major Concept). It provides the location where the Major Concept of the exact match is stored. Like EXM, there are two forms of this segment, they are:

1. The list still exists and the user is reviewing the entries on the list for selection:

   LEX("EXC")=<position on the list>^<term>

   Example: User searches the Lexicon for "CHF"

   5 matches found
   1. CHF (exact match, synonym to Major Concept)
   2. Congestive Heart Failure (Major Concept of exact match)
   3. Other match
   4. Yet another match
   5. ....
Select 1-5: 1//

2. The list no longer exists because the user has either made a selection from the entries on the list or has reviewed all the entries on the list without making a selection:

LEX("EXC")=<IEN>^<term>

15.2.7 Help Array

LEX("HLP")

Help text to be displayed (or term definition) when the user’s response contains a "?"

15.2.8 List Array

LEX("LIST")

Contains only those entries that should be displayed to the user for selection. It differs from ^TMP("LEXFND") which contains all matches found and ^TMP("LEXHIT") which contains all entries reviewed by the user. It can be thought of as a single page of the selection list with a page length defined by the calling application at the time the search is initiated (the third input parameter of LOOK^LEXA). The default page length of the displayable list is 5, displaying 5 entries at a time until the user has reviewed all the entries on the list or made a selection from the list.

15.2.9 User Narrative

LEX("NAR")

This is the text string that the user inputs to the lookup. It only exists if the calling application uses the Unresolved Narrative function of the Lexicon.

15.2.10 Matches Found String

LEX("MAT")

This text string indicates the total number of entries found during the search, and it is only available during the initial review of the list and when the user is at the top of the list. Examples might be 1 match found or 36 matches found, and could be used as:

22 matches found

1. Condition
2. Condition without mention of complications
3. Condition in late stages of development
4. Condition ....
5. Condition ....

Select 1-5:

15.2.11 Maximum Selection

LEX("MAX")

This segment only exists if a selection from the list is possible. When it exists, it sets to the number of the last entry on the list that the user has reviewed, not the total number of entries found. The total number of entries found is stored at LEX. LEX is frequently greater that LEX("MAX") until the user has reached the end of the list, then they are the same. If the last entry on the list that a user has reviewed was 30, and the user jumps backwards on the list (jumps from entry 30 to entry 8), LEX("MAX") remains at 30.

We suggest that both LEX("MIN") and LEX("MAX") may be used to build a selection prompt (formerly DIC("A")) for the user. For example:

Select _LEX("MIN")--LEX("MAX")_: 

15.2.12 Minimum Selection

LEX("MIN")

This segment only exists if a selection from the list is possible. When it exists, it should always be set to 1.
15.2.13 Response from the User

This segment contains the last response from the user. It only exists if the global array ^TMP("LEXSCH") exists.

15.2.14 Selection Array

Returned information about the user's selection (formerly a non-negative Y in Version 1.0). The absence of this array segment at the conclusion of the user's review of the list implies that no selection was made or that the user up-arowed out of the selection process (implied -Y). The calling application must extract from the array the information needed and delete the array. The following is an example of the SEL array:

```plaintext
LEX("SEL","EXP",0)=5
LEX("SEL","EXP",1)=22600^Sexual Abuse of Child
LEX("SEL","EXP",2)=22601^Child Molestation, Sexual

The LEX("SEL") array is in 5 segments:

**Expressions**

LEX("SEL","EXP")

Contains the expressions selected by the user in the same format as FileMan's returned variable Y. This portion of the array includes the Major Concept and all Synonyms and Lexical Variants.

LEX("SEL","EXP",1) is always the expression selected by the user. This segment has two indexes:

- B Internal Entry Point of the Expression file #757.01.
- C Expression type; (MAJ)or concept, (SYN)onym, and (LEX)ical variants

**Significance**

LEX("SEL","SIG")

Contains the definition of the Major Concept, if one exists.

**Sources**

LEX("SEL","SRC")

Contains source codes for specified classification systems (i.e., ICD, CPT, DSM, etc.) for the expressions contained in LEX("SEL","EXP"). Each entry contains the classification system nomenclature, the classification code, and the internal entry number to the expression in file 757.01 to which it is mapped.

All classification codes returned in this segment are active codes based on the versioning date provided. If no date is provided, then all codes returned in this array are active as of TODAY (default).

This segment has three indexes:

- B Classification System Nomenclature
- C Classification Code
- D Internal Entry Number to file 757.01

**Semantics**

LEX("SEL","STY")

Contains the Semantic Class and the Semantic Type of the Major Concept contained in LEX("SEL","EXP").

**VA Sources**

LEX("SEL","VAS")

If one or more of the sources in LEX("SEL","SRC") is found in one of the primary VA authoritative files, then this section contains the file number, variable pointer, the source code, an internal entry number to the Lexicon expression, the source abbreviation, and the source name. The primary VA authoritative files pointed to include file #80 (ICD Diagnosis), file #80.1 (ICD Procedures), file #81 (CPT), and file #627.7
(DSM-IV). There exist one exception, Title 38 disability codes for which the Lexicon CODES file #757.02 is the authoritative file.

LEX("SEL","VAS",1)="80^2895;ICD9(^530.6^270063^ICD^ICD-9-CM"
LEX("SEL","VAS",2)="757.02^317612;LEX(757.02,^7205^270063^SCC^TITLE 38"
LEX("SEL","VAS",#)=File #^Variable Pointer^Code^IEN^SAB^Source

For each entry, an activation history is provided including the effective date, the status, and a comment.

LEX("SEL","VAS",1,1)="2781001^1^Activated"
LEX("SEL","VAS",#,#)=effective date^status^comment

All classification codes returned in this segment are active codes based on the versioning date provided. If no date is provided, then all codes returned in this array are active as of TODAY (default).

This segment has five indexes:

- B VA authoritative file number
- C Classification Code
- D Internal Entry Number to file 757.01
- S Source Abbreviation
- V Variable pointer to the authoritative file

### 15.3 Controlling the View

#### 15.3.1 View by Semantic Class and Types

The Lexicon provides for filtering the search to view only those terms that semantically fit into a class and type, or a group of classes and types. We listed these classes and types in Appendix A of this document. The Lexicon uses a string of identifiers indicating the classes and types to either include or exclude in a search. This string is in two parts (delimited by a ";") of those classes and types to include in the search and those classes and types to exclude. The ‘include’ portion of the string has precedence over the ‘exclude’ portion. The insertion of a class into the string represents all of the types belonging to that class; consequently, it is not necessary to repeat all of the types with the class. The absence of a class/type in the include portion of the string automatically excludes it from the search. Semantic classes are represented by a 3-character mnemonic and semantic types are represented numerically (provided by NLM UMLS). For example:

The string BEH/DIS/44/45/49/167/4/5/7/PHY/PRO;50 translates to:

<table>
<thead>
<tr>
<th>INCLUDE:</th>
<th>EXCLUDE:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Behaviors</td>
<td>Activities</td>
</tr>
<tr>
<td>Diseases/Pathologic</td>
<td>Anatomy</td>
</tr>
<tr>
<td>Process</td>
<td></td>
</tr>
<tr>
<td>Physiology</td>
<td>Chemicals and Drugs</td>
</tr>
<tr>
<td>Procedures</td>
<td>Concepts and Ideas</td>
</tr>
<tr>
<td>Fungus</td>
<td>Geographic Areas</td>
</tr>
<tr>
<td>Virus</td>
<td>Groups</td>
</tr>
<tr>
<td></td>
<td>Nucleic Acid</td>
</tr>
<tr>
<td></td>
<td>Nucleoside or Nucleotide</td>
</tr>
<tr>
<td></td>
<td>Amino Acid, Peptide or Protein</td>
</tr>
<tr>
<td></td>
<td>Gene Product</td>
</tr>
<tr>
<td></td>
<td>Plant</td>
</tr>
<tr>
<td></td>
<td>Alga</td>
</tr>
</tbody>
</table>
The Lexicon lets you filter the search to view only those terms linked to a specified classification system. These classification systems (provided by both the NLM and the VA) are represented by a 3 character mnemonic and are listed in Appendix B of this document. The Lexicon uses a string of mnemonic identifiers indicating the classification systems to include in a search. For example:

The string: "ICD/CPT/DS4" translates to:

- Include terms linked to:
  - ICD-9: International Classification of Diseases
  - DSM-IV: Diagnostic and Statistical Manual of Mental Disorders

15.3.3 View by both Semantics and Classification Systems

This is a combination of the two previous views. In this scenario, if the search encounters a term which is to be excluded from the search by virtue of the semantics, but the term is found to be linked to one of the specified classification systems, then the term is included in the search, ignoring the instruction to exclude the term based on semantics. An example of this type of string would be:

"BEH/DIS/44/45/49/4/5/7/PHY/PRO;50;ICD/CPT"

15.3.4 View by Subset

This is not a filtered view in the sense of including/excluding terms from a selection list. A sub-set is a group of terms based on a common theme (e.g., specialty, function, etc.) which are indexed separately from the main word index in the Lexicon. This type of view has two distinct advantages over filtering: 1) it is significantly faster since it does not have the additional burden of deciding whether to include or exclude a term, and 2) it imposes a limit on the search, making it impossible to find a term not contained in the sub-set (e.g., Diabetes Mellitus could not be found within the Dental sub-set).
15.3.5 Other Views

The Lexicon is always open to new methods of changing the view to suit the client application using the existing structures and fields. New fields can be created to support new functionality; however, it should be done with great care and thought (an 8-character mandatory field adds 2 megabytes to the Lexicon). Generally, if the view can be described, then it can be created.

16. Searching the Lexicon: Building and Reordering the List

The Lexicon reorders the results of a search beginning with the exact match (if found) followed by other matches in descending order of frequency of use. The reordering of the search results occurs after the search has been completed and while the user is reviewing the matches found. In order to do this, the Lexicon must build three lists. These lists include:

16.1 Matches Found

\[^\text{TMP}({^{\text{"LEXFND"}},$J})\]

This list is built while the search is in progress. Each time a match is found, that term is placed on this list in an order based on a term's frequency of use and Internal Entry Number (IEN) from the Expression file (#757.01). When the search is completed, this list contains all of the matches found.

As the user reviews the matches found, entries are taken off this list and placed on the review list \[^\text{TMP}({^{\text{"LEXHIT"}}})\] until the user either selects an entry, terminates the selection process by entering an up-arrow (^), or reaches the end of the list. As the user continues to review the matches found, this list continues to shrink until it no longer exists.

16.2 Matches Reviewed

\[^\text{TMP}({^{\text{"LEXHIT"}},$J})\]

The Lexicon begins to build this list only after the search has completed. This list is initially populated with the first few entries to be reviewed by the user (the exact number is determined by the third input parameter of LOOK^LEXA). Entries on this list are ordered sequentially from one to the total number of matches reviewed by the user.

As the user reviews the matches found, entries are added to this list from the list of matches found in \[^\text{TMP}({^{\text{"LEXFND"}}})\] until the user either selects an entry, terminates the selection process by entering an up-arrow (^), or reaches the end of the list. As the user continues to review the matches found, this list continues to grow until it contains all of the matches found.

16.3 Matches Displayed

\[\text{LEX({"LIST"})}\]

This list contains only those entries to be displayed. The length of this list does not exceed the list length as specified by the calling application in the third input parameter of LOOK^LEXA. If the list length is not specified by the calling application, then the default list length is set to 5.

16.4 Example Search

The user searches the Lexicon with the following results:

- Matches found: 20
- List Length (specified by the calling application): 5
Initially the list of matches found in ^TMP("LEXFND") would contain 20 entries; however, when the search is completed and the selection process begins, the first five (5) entries are taken off the list of matches found in ^TMP("LEXFND") and placed on both the review list in ^TMP("LEXHIT") and the display list in LEX("LIST"). The calling application should display the contents of the display list LEX("LIST") for the user to review.

If the user does not select one of the first five (5) entries on the display list in LEX("LIST") and presses <Return> to review the next five, then an additional five entries are taken from the list of matches found in ^TMP("LEXFND") and placed on the review list in ^TMP("LEXHIT") with only the current five entries being placed on the display list in LEX("LIST"). The calling application should again only display the five entries on the display list LEX("LIST").

As long as the user does not make a selection, and keeps pressing <Return>, entries are taken from the list of matches found in ^TMP("LEXFND") and placed on the review list in ^TMP("LEXHIT") with the current five entries on the display list in LEX("LIST"). Once the user gets to the end of the list, the list of matches found in ^TMP("LEXFND") is depleted, and the list of entries reviewed in ^TMP("LEXHIT") has 20 entries. The display list in LEX("LIST") always has the number of entries specified by the calling application (in this case, five).

If the user has reviewed some or all of the matches found and decides to jump backwards on the list, then the display list in LEX("LIST") is populated from the list of entries reviewed in ^TMP("LEXHIT").

17. Unresolved Narratives

It is possible for users and applications to provide feedback from the sites regarding the content of the Lexicon. This is done either by a user through a calling application (user unresolved narratives) or by the calling application (application unresolved narratives).

Which applications should use Unresolved Narratives? Chances are if the vocabulary which the targeted users are employing is subject to a myriad of synonyms and lexical variants (e.g. plurals, singular form, etc.), then the application should use the Unresolved Narrative functionality. Applications which would not want to use Unresolved Narratives are those which use an extremely controlled vocabulary where a single concept has only one acceptable form or if adding terminology would disrupt the content and purpose of the controlled vocabulary.

17.1 User Unresolved Narratives

There are three prerequisites the calling application must meet to use and return User Unresolved Narratives:

1. The calling application must be able to store the text within the calling application or store the text in an alternate file (i.e., the Provider Narrative file) and point to the text.
2. The calling application must be defined in the Subset Definition file (#757.2).
3. The Unresolved Narrative flag in the Subset Definition file for the calling application must be set to 1.

There are two prerequisites the Lexicon must meet to save and return the User Unresolved Narrative:

1. The lookup must have completed with no selection made. This is determined by the absence of the following arrays:

   ^TMP("LEXFND",$J)
   ^TMP("LEXHIT",$J)
LEX("LIST")
LEX("SEL")

2. The Lexicon must have knowledge of the conditions under which the User Unresolved Narrative occurred. This is determined by the presence of the array:

^TMP("LEXSCH",$J)

When a User Unresolved Narrative occurs, and the conditions above are met, the calling application may store and return the User Unresolved Narrative by calling the entry point:

EN^LEXAR(<user unresolved narrative text>)

When this is done, the User Unresolved Narrative is temporarily stored in the Unresolved Narratives file (757.06). Periodically the Lexicon Utility packs the entries in this file into a mail message and sends them to G.LEXICON@ISC-SLC.VA.GOV for consideration for inclusion in the Lexicon. After the Lexicon Utility sends this message, it deletes the entries in this file.

The following information about the narrative and the conditions of the search may be returned to the OI Field Office:

<table>
<thead>
<tr>
<th>Narrative</th>
<th>Mandatory</th>
<th>User Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date-Time</td>
<td>Mandatory</td>
<td>When the search was conducted</td>
</tr>
<tr>
<td>Search String</td>
<td>Mandatory</td>
<td>Actual search string</td>
</tr>
<tr>
<td>Matches</td>
<td>Mandatory</td>
<td>Number of matches found</td>
</tr>
<tr>
<td>Application</td>
<td>Mandatory</td>
<td>Name of the calling application</td>
</tr>
<tr>
<td>Service</td>
<td>Optional</td>
<td>Service of the user</td>
</tr>
<tr>
<td>File</td>
<td>Mandatory</td>
<td>Number of file searched</td>
</tr>
<tr>
<td>Index</td>
<td>Mandatory</td>
<td>Name of the index used</td>
</tr>
<tr>
<td>Shortcuts</td>
<td>Optional</td>
<td>Name of the Shortcut set used</td>
</tr>
<tr>
<td>Screen</td>
<td>Optional</td>
<td>Screen used (MUMPS code)</td>
</tr>
</tbody>
</table>

User Unresolved Narratives received at the IRM Field Office are reviewed and classified as:

1. A valid expression to be linked (e.g., synonym or lexical variant).
2. A valid expression to be added (no equivalent concept in the current version).
3. A valid expression in the current version containing a spelling error, acronym, or abbreviation not previously defined. Only the spelling error, acronym, or abbreviation is linked to the existing expression while the remainder of the expression is ignored.
4. A valid expression in the current version.
5. An invalid expression is ignored (e.g., XXXX?).

If the User Unresolved Narrative is included in a future release of the Lexicon and exported to the site, it becomes the responsibility of the calling application to resolve the entry at the site. The Problem List application is the only exception at this time. When a new release of the Lexicon Utility is installed at a site, the Problem List is updated by a series of routines (LEXPL*) called by the Lexicon Utility’s Post-Install.
17.2 Application Unresolved Narratives

The purpose of this type of unresolved narrative is to permit the calling application to return a comment about an existing term in the Lexicon. This occurs when an application detects a problem with an expression in the Expression file (757.01). The application can return the Internal Entry Number (IEN) of that expression along with a short comment stating the problem. These commented, unresolved narratives are also temporarily stored and periodically packed up into a mail message that is sent to G.LEXICON@ISC-SLC.VA.GOV. However, instead of considering these narratives for inclusion in the Lexicon (since they already exist), the problem stated in the comment field is reviewed and action is taken where appropriate.

There are no prerequisites for the calling application; however, the lookup for the Lexicon must not be engaged (determined by the absence of all Lexicon variables and arrays).

The following information about the expression is returned to the IRM Field Office:

<table>
<thead>
<tr>
<th>Narrative</th>
<th>Mandatory</th>
<th>User Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expression</td>
<td>Mandatory</td>
<td>Pointer to file #757.01</td>
</tr>
<tr>
<td>Comment</td>
<td>Mandatory</td>
<td>Brief description of the problem</td>
</tr>
</tbody>
</table>

When an Application Unresolved Narrative occurs, the calling application may store and return the Application Unresolved Narrative by calling the entry point:

   EN^LEXAR(<IEN^Comment>)

An application comment is in the general format IEN^COMMENT, where IEN is a pointer to an expression in the Expression file (757.01) and the COMMENT is a text string comment about the expression.

Examples of application comments might be:

   IEN^Diagnostic term maps to 799.9

   This type of comment might be used by an application which requires a valid ICD with a diagnostic term (as is the case with Problem List). If the Lexicon returns the term without an ICD or with ICD code not found in the ICD-9 file (#80), then the application could take advantage of this entry point to instruct the developers of the Lexicon to have Medical Records Technicians look at, evaluate, and match the term to an appropriate ICD code for future iterations of the Lexicon.

   IEN^RBBB suggested shortcut for Right bundle branch block

   This type of comment might be used when the user input RBBB fails to return a selection list, and on a subsequent search the user entered bundle branch block and selected Right bundle branch block, implying that RBBB was intended to have found Right bundle branch block.

18. Re-indexing the Lexicon

For re-indexing, the Lexicon can be divided into two types of files: Those which can be re-indexed independently and those which are re-indexed conditionally. If there is a need to re-index the Lexicon, the files should be re-indexed as follows.
These files may be independently re-indexed.

- 757 Major Concept Map
- 757.011 Expression Type
- 757.014 Expression Form
- 757.03 Coding System
- 757.033 Character Positions
- 757.04 Excluded Words
- 757.06 Unresolved Narratives
- 757.11 Semantic Classes
- 757.12 Sub-Set Definitions
- 757.3 Lookup Screens
- 757.32 Mapping Definitions
- 757.33 Mappings
- 757.4 Shortcuts
- 757.41 Shortcut Context

These files have conditions placed on the re-indexing.

- 757.01 Expressions
  Immediately after re-indexing this file, re-index the Replacement Word file #757.05 (also see 757.05 listed below).
- 757.02 Codes
  Re-index the Coding Systems file #757.03 first.
- 757.05 Replacement Words
  Re-indexing of this file depends on indexes in the Expressions file #757.01. If the indexes in file #757.01 are intact and current, then proceed with re-indexing of the Replacement Word file; otherwise, re-index file #757.01 first.
- 757.1 Semantic Map
  Re-index both the Semantic Class file #757.11 and the Semantic Type file #757.12 first.
- 757.21 Sub-Sets
  Re-indexing of this file depends on indexes in the Sub-Set Definition file #757.2. If the indexes in file #757.2 are intact and current, then proceed with re-indexing of the Sub-Sets file; otherwise, re-index file #757.2 first.

19. Subsets

Subsets, also known as vocabularies, are a collection of terms from the Lexicon that serve a specific purpose or discipline. There are two types of Subsets:

19.1 Logical Subset
This is a collection of terms found in the Lexicon that are set apart from the main Lexicon content through the use of filters and screens similar to Fileman’s DIC (“S”).

Example: The "CPT/HCPCS Procedures" subset is artificially created through the use of a filter which will not permit the selection of a term that is not linked to a valid CPT-4 or HCPCS procedure.

19.2 Physical Subset

This is a collection of terms found in the Lexicon that have been physically set apart from the main Lexicon content by storing the terms in the Subset file 757.21. A physical subset has the advantages of being faster... essentially, it is searching a shorter list. As a result, the search does not need to inspect hundreds of records to determine if the term is contained in a subset. A physical subset has two disadvantages: First, if the physical subset is large, it will significantly increase the disk space requirements for the Lexicon global. Secondly, a physical subset requires constant maintenance (any change made in the Expression file 757.01 needs to be reflected in the Subset file 757.21).

Example: The "Nursing" subset contains terminology from the North American Nursing Diagnosis Association (NANDA), the Nursing Intervention Classification (NIC) and the Omaha Nursing Diagnosis classification systems and is physically stored in the Subset file 757.21.

19.3 Application Subset

An application subset can be either a Logical or Physical Subset. It is developed specifically for an application. An application may have one (primary) or more (secondary) subsets. The application subset will contain the applications namespace on the primary subset and an abbreviated namespace on all secondary subsets. The primary subset will also contain the file number where the pointer to the Lexicon is stored. The Expression file 757.01 needs to be reflected in the Subset file 757.21).

Example: Problem List subset is an application subset created for the Problem List application. It contains the namespace of GMPL and the file number of 9000011. It has a primary subset (PL1) which filters on semantic classes and types and a secondary subset (PL2) which filters on coding system (ICD-9 only).

19.4 Creating an Application Subset
Applications requiring a subset would coordinate with a Lexicon developer for the creation, addition and export of the application subset to the field. The following information will be needed:

<table>
<thead>
<tr>
<th>Field</th>
<th>Field Content</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>

## 21. Package Security

Package Security for the Lexicon Utility is maintained through option assignments and VA FileMan Security Codes. We recommend that options and menus be assigned as shown below:

**Options recommended for all users:**

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Menu</th>
<th>Routine</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lexicon Utility</td>
<td>LEX UTILITY</td>
<td>Menu</td>
</tr>
<tr>
<td>Lookup Term</td>
<td>LEX LOOK-UP</td>
<td>LEXLK</td>
</tr>
<tr>
<td>User Defaults</td>
<td>LEX USER DEFAULTS</td>
<td>Menu</td>
</tr>
<tr>
<td>Filter</td>
<td>LEX USER FILTER</td>
<td>EN^LEXDFL</td>
</tr>
<tr>
<td>Display</td>
<td>LEX USER DISPLAY</td>
<td>EN^LEXDCC</td>
</tr>
<tr>
<td>Vocabulary</td>
<td>LEX USER VOCABULARY</td>
<td>EN^LEXDVO</td>
</tr>
<tr>
<td>Shortcuts</td>
<td>LEX USER SHORTCUTS</td>
<td>EN^LEXDCX</td>
</tr>
<tr>
<td>List Defaults</td>
<td>LEX USER DEFAULT LIST</td>
<td>EN^LEXDDS</td>
</tr>
</tbody>
</table>
### Options recommended for managers only:

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Menu</th>
<th>Routine</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lexicon Management Menu</td>
<td>LEX MGT MENU</td>
<td>Menu</td>
</tr>
<tr>
<td>Defaults</td>
<td>LEX MGR DEFAULTS</td>
<td>Menu</td>
</tr>
<tr>
<td>Edit User/User Group Defaults</td>
<td>LEX MGR USER DEFAULTS</td>
<td>LEXDMG</td>
</tr>
<tr>
<td>Edit User/User Group Defaults</td>
<td>LEX MGR LIST DEFAULTS</td>
<td>LEXDD1</td>
</tr>
<tr>
<td>Edit Lexicon</td>
<td>LEX MGR EDIT LEXICON</td>
<td>Menu</td>
</tr>
<tr>
<td>Edit Term Definition</td>
<td>LEX MGR EDIT DEFN</td>
<td>LEXEDF1</td>
</tr>
<tr>
<td>Edit Shortcuts by Context</td>
<td>LEX MGR EDIT SHORTCUTS</td>
<td>LEXSC</td>
</tr>

</table>

### 21.1 Use of data by Salt Lake City IRM Field Office Developers:

#### Unresolved Narratives:

To expand the Lexicon Utility’s terms, synonyms, abbreviations, etc., the Salt Lake City IRM Field Office developers have created a program which captures and stores user-entered terminology that doesn’t match existing Lexicon terminology.

When users conduct searches in the Lexicon Utility and a match is not found, the text that is entered is saved into the Unresolved Narratives file (#757.06). When the file contains 50 entries, a mail message is generated to transmit the contents of this file to the developers and then entries are purged from the file. This terminology is considered for inclusion in future releases of the Lexicon Utility.

#### Term Definitions:

When a site edits the content of the Definition field in the Expression file (#757.01), the changes are recorded and a mail message is generated sending the changes to the Salt Lake City IRM Field Office developers. The changes are considered for updating the Lexicon Utility.

#### VA FileMan Security Codes:

All files are exported with the following security codes:

<table>

22. SACC Exemptions/Non-Standard Code

A SACC exemption was granted on May 9, 2013 to the Clinical Lexicon package (distribution package for ICD data) for the purpose of enabling unsubscripted global kills in the pre-install using FileMan DIU2 utility. This is used when a “full file” distribution is made (delete file 80/80.1 and replace). The exemption reads as follows:

Clinical Lexicon requests an exemption to use $ZU in the pre and post install routines for future LEX patches. This exemption will expire with the release of LEX 3.0. Calling $ZU(68,28,0) to enable an unsubscribed global kill prior to installing the latest ICD files leaves the possibility that a global will be killed by another process during a lengthy installation. Placing the call in the pre (or post) install, instead of making the call manually before and after the install, cuts this window down to a few seconds.

### 24. Appendix B: Semantic Classes and Types

1. **Activities**

   **Event**
   
   A broad type for grouping activities, processes, and states. The children of this type are Activity and Phenomenon or Process.

   **Activity**
   
   An operation or series of operations that an organism or machine carries out or participates in. The children of this type are Behavior, Daily or Recreational Activity, Occupational Activity, and Machine Activity. Examples include Development Planning, Expeditions, Information Distribution, Migration, and Voting.

   **Daily or Recreational Activity**
   
   An activity carried out for recreation or exercise. Examples include Swimming, Camping, Child Care, and Exercise.

   **Occupational Activity**
   
   An activity carried out as part of an occupation or job. The children of this type are Health Care Activity, Research Activity, Governmental or Regulatory Activity, and Educational Activity. Examples include Financial Management, Collective Bargaining, Commerce, and Book Classification.

   **Health Care Activity**
   
   An activity of or relating to the practice of medicine or involving the care of patients. The children of this type are Diagnostic Procedure, Laboratory Procedure, and Therapeutic or Preventive Procedure. Examples include Preventive Health Services, Ambulatory Care, Clinic Activities, and Geriatric Nursing.

   **Research Activity**
   
   An activity carried out as part of research or experimentation. This type has one child in the network, Molecular Biology Research Technique. Examples include Study Design, Animal Experimentation, Biomedical Research, and Cluster Analysis.

   **Governmental or Regulatory Activity**
   
   An activity carried out by officially constituted governments, or an activity related to the creation or enforcement of the rules or regulations governing some field of endeavor. Examples include Facility Regulation and Control, Public Assistance, Credentialing, and Certification.

   **Educational Activity**

</table>
An activity related to the organization and provision of education. Examples include Community Health Education, Preceptorship, Academic Training, and Family Planning Training.

Machine Activity

An activity carried out primarily or exclusively by machines. Examples include Air Conditioning, Equipment Failure, Natural Language Processing, Computer Simulation, and Word Processing.

Phenomenon or Process

A process or state which occurs naturally or because of an activity. The children of this type are Human-caused Phenomenon or Process, Natural Phenomenon or Process, and Injury or Poisoning. Examples include Disasters, Famine, and Noise.

Human-caused Phenomenon or Process

A phenomenon or process that is a result of the activities of human beings. If the term refers to the activity itself, rather than the result of that activity, a type from the Activity hierarchy is assigned instead. This type has one child in the network, Environmental Effect of Humans. Examples include Social Change, Baby Boom, and International Cooperation.

Environmental Effect of Humans

A change in the natural environment that is a result of the activities of human beings. Examples include Water Pollution, Acid Rain, Soil Degradation, and Smog.

Natural Phenomenon or Process

A phenomenon or process that occurs irrespective of the activities of human beings. This type has one child in the network, Biologic Function. Examples include Lightning, Air Movements, Sunlight, Biological Phenomena, and Corrosion.

2. Anatomy

Anatomical Structure

A normal or pathological part of the anatomy or structural organization of an organism. If the term refers to a structure found only in non-humans, the Non-Human flag is assigned as well. Examples of this would be such terms as Feathers, Gills, and Horns. The children of this type are Embryonic Structure, Congenital Abnormality, Acquired Abnormality, and Fully Formed Anatomical Structure.

Embryonic Structure

An anatomical structure that exists only before the organism is fully formed; in mammals, for example, a structure that exists only prior to the birth of the organism. This structure may be normal or abnormal. Examples include Neural Crest, Blastoderm, and Fetal Heart.

Congenital Abnormality

An abnormal structure, or one that is abnormal in size or location, present at birth or evolving over time because of a defect in embryogenesis. Examples include Congenital cranial meningocele and Syndactyilia.

Acquired Abnormality

An abnormal structure or one that is abnormal in size or location, found in or deriving from a previously normal structure. Examples include Hernia, Fistula, Hemorrhoids, and Varicose Veins.

Fully Formed Anatomical Structure
An anatomical structure in a fully formed organism; in mammals, for example, a structure in the body after the birth of the organism. The children of this type in the network are Body Part, Organ, or Organ Component, Tissue, Cell, Cell Component, and Macromolecular Structure. They are linked to each other by the part_of relationship in the network. Thus, a Macromolecular Structure is part of a Cell Component, which is part of a Cell, etc. A term is assigned to the most specific type available.

Body System
A complex of anatomical structures that performs a common function. Examples include Renin-Angiotensin System, Limbic System, Skeleton, and Reticuloendothelial System.

Body Part, Organ, or Organ Component
A collection of cells and tissues which are localized to a specific area or combine and carry out one or more specialized functions of an organism. This ranges from gross structures to small components of complex organs. These structures are relatively localized in comparison to tissues. Examples include Eye, Liver, Pulmonary Artery, and Laryngeal Mucosa.

Tissue
An aggregation of similarly specialized cells and the associated intercellular substance. Tissues are relatively non-localized in comparison to body parts, organs, or organ components. Examples include Cartilage, Epidermis, Basophilic muscle fibers, and Endothelium.

Cell
The fundamental structural and functional unit of living organisms. Examples include Erythrocytes, Dendritic Cells, and Histiocytes.

Cell Component
A part of a cell or the intercellular matrix, generally visible by light microscopy. Examples include Golgi Apparatus, Microsomes, and Organelles.

Body Location or Region
An area, subdivision, or region of the body demarcated for the purpose of topographical description. If the term refers to a body location or region found only in non-humans, the Non-Human flag is assigned as well. Examples include Abdomen, Thorax, Back, and Gluteal Region.

Body Space or Junction
An area enclosed or surrounded by body parts or organs or the place where two anatomical structures meet or connect. If the term refers to a body space or junction found only in non-humans, the Non-Human flag is assigned as well. Examples include Synapses, Peritoneal Cavity, Neuromuscular Junction, and Knee Joint.

Body Substance
Extracellular material, or mixtures of cells and extracellular material, produced, excreted, or accreted by the body. Included here are substances such as saliva, dental enamel, sweat, and gastric acid. If the term refers to a body substance found only in non-humans, the Non-Human flag is assigned as well. Examples include Saliva, Necrotic debris, Mucus, and Amniotic Fluid.

3. Behavior

Behavior
Any of the activities of humans or animals that can be observed directly by others or can be made systematically observable by the use of special strategies. If the term refers to a behavior
exhibited only by non-humans, the Non-Human flag is assigned as well. The children of this type are Social Behavior and Individual Behavior.

Social Behavior

Behavior that is a direct result or function of the interaction of humans or animals with their fellows. Examples include Interpersonal Relations, Social Conformity, Acculturation, and Communication.

Individual Behavior

Behavior exhibited by a human or an animal that is not a direct result of interaction with other members of the species, but which may have an effect on others. Examples include Assertiveness, Self Disclosure, Nail Biting, and Risk-Taking.

4. Chemicals and Drugs

Chemical

Chemicals are viewed from two distinct perspectives in the network, functionally and structurally. Almost every chemical term is assigned at least two types, one from the structure hierarchy and at least one from the function hierarchy. The children of this type are Chemical Viewed Functionally and Chemical Viewed Structurally.

Chemical Viewed Structurally

A chemical viewed from the perspective of its structural characteristics. Included here are terms which can mean a salt, an ion, or a compound (e.g., Bromates and Bromides). The children of this type are Inorganic Chemical and Organic Chemical. Examples include Free Radicals, Onium Compounds, Salts, and Sulfur Compounds.

Inorganic Chemical

The general class of substances including the elements, their ionic and isotopic counterparts, and any chemical compound whose molecules are bound together ionically rather than covalently. This includes all compounds which do not contain carbon as a principal component. The children of this type are Element or Ion, Isotope, and Inorganic Compound. Examples include Electrolytes, Dithionite, and Technetium Tc 99m Sulfur Colloid.

Element or Ion

One of the 109 presently known kinds of substance that comprise all matter at and above the atomic level. This includes elemental metals, rare gases, and naturally occurring radioactive elements, as well as the ionic counterparts of elements. This does not include the less abundant isotopic forms, for which the type Isotope is assigned. Examples include Aluminum, Carbon, Uranium, Beryllium, and Oxygen Ion.

Isotope

A form of element having the same atomic number (i.e., the same number of protons), but differing in atomic weight or mass due to the presence of one or more additional neutrons. Included here are both stable and radioactive isotopes. Examples include Radioisotopes, Chromium Isotopes, Cobalt Radioisotopes, Co-58 (8), and Deuterium.

Inorganic Compound

A single compound, generally with ionic bonding, not containing carbon as a principal component (except carbides, carbonates, cyanides, cyanates, and carbon disulfide). The bonding between elements in inorganic compounds is generally ionic. Included here are inorganic acids.
and salts, alloys, alkalies, and minerals. Excluded are hydrocarbons. Examples include Ferrocyanide salt, Ammonia, and Aluminum Hydroxide.

Organic Chemical

The general class of carbon-containing compounds usually based on carbon chains or rings, and containing hydrogen (hydrocarbons), with or without nitrogen, oxygen, or other elements. The bonding between elements is generally covalent. The children of this type are Steroid, Eicosanoid, Lactam, Alkaloid, Nucleic Acid, Nucleoside, or Nucleotide, Organophosphorus Compound, Amino Acid, Peptide, or Protein, Carbohydrate, and Lipid. Examples include Busulfan, Carotene, Trinitrobenzene, and Metanephrine.

Steroid

One of a group of polycyclic, 17-carbon-atom, fused-ring compounds occurring both in natural and synthetic forms. Included here are naturally occurring and synthetic steroids, bufanolides, cardanolides, homosteroids, norsteroids, and secosteroids. Examples include Bufanolides, Norandrostanes, 17-Hydroxycorticosteroids, and Prednisone.

Eicosanoid

A compound structurally related to arachidonic acid. Included here are arachidonic acid, eicosanoic acid, and saturated or unsaturated derivatives of each. Examples include Thromboxane B2, n-Eicosanoic acid, 8,11,14-Eicosatrienoic Acid, and Leokotriene C-4.

Lactam

A cyclic amide, usually with 4- or 5-membered rings that may or may not be fused to other rings, as in compounds structurally related to the penicillins and cephalosporins. Examples include Penicillanic Acid, Caprolactam, Alloxan, and Ticarcillin.

Alkaloid

A basic, nitrogen-containing compound of plant origin. Included here are aporphines, cinchona, curare, ergot, opium, belladonna, rauwolfia, and vinca alkaloids, among others. Examples include Quinidine, Aconitine, 3-Hydroxy-N-Methylmorphinan, Vincamine, and Rauwolfia Alkaloids.

Organophosphorus Compound

An organic compound containing phosphorus as a constituent. Included here are organic phosphinic, phosphonic and phosphoric acid derivatives and their thiophosphorus counterparts. Excluded are phospholipids and sugar phosphates. Examples include Phosphonoacetic Acid, Phosphoric Acid Esters, Diphosphonates, and Thiamine Triphosphate.

Carbohydrate

A compound consisting of carbon, hydrogen, and oxygen in which the hydrogen/oxygen ratio is the same as in water, and in which repeating units are joined through oxygen linkages. Carbohydrates are generally characterized as sugars and include mono-, di-, oligo-, and polysaccharides, glycosides, glycans, and starches. Included here are sugar phosphates. Excluded are glycolipids. Examples include Glycosides, Polysaccharides, Deoxyglucose, and Sepharose.

Lipid

A fat or fat-derived substance, such as fatty acids, fatty alcohols, and waxes. Included here are glyco- and phospholipids. Examples include Ceroid, Sphingolipids, Glycerides, and Calcifediol.
A chemical viewed from the perspective of its functional characteristics or pharmacological activities. The children of this type are Pharmacologic Substance, Biomedical or Dental Material, Biologically Active Substance, Indicator or Reagent, and Hazardous or Poisonous Substance. Examples include Aerosol Propellants, Soaps, and Food Additives.

Pharmacologic Substance

A substance used in the treatment, diagnosis, prevention, or analysis of normal and abnormal body function. This includes substances that occur naturally in the body and are administered therapeutically. Examples include Codeine, Antipruritics, Ampicillin, Cardiovascular Agents, Insulin, and Ganglionic Blockaders.

Biomedical or Dental Material

A substance used in biomedicine or dentistry predominantly for its physical, as opposed to chemical, properties. Included here are biocompatible materials, tissue adhesives, bone cements, resins, etc. Examples include Anion Exchange Resins, Dental Casting Investment, Elastosil, Bone Cements, and Drug Implants.

Biologically Active Substance

A substance produced or required by an organism, of primary interest because of its role in the biologic functioning of the organism that produces it. The children of this type are Neuroreactive Substance or Biogenic Amine, Hormone, Enzyme, Vitamin, Prostaglandin, and Immunologic Factor. Examples include Myelin, Gastric Acid, Growth Substances, and Enzyme Precursors.

Neuroreactive Substance or Biogenic Amine

A biologic factor whose activities affect or play a role in the functioning of the nervous system. Included here are catecholamines, neuroregulators, neurophysins, etc. Examples include Catecholamine, Tryptamines, and Neurotensin.

Hormone

In animals, a chemical secreted by an endocrine gland that releases its products into the circulating fluid. Plant hormones or synthetic hormones that are used only to alter or control various physiologic processes, e.g., reproductive control agents, are assigned only to the type Pharmacologic Substance. Hormones act as chemical messengers and regulate various physiologic processes such as growth, reproduction, metabolism, etc. They usually fall into two broad classes, steroid hormones and peptide hormones. Examples include Gonadotropins, Epicortisol, Glucocorticoids, Pentagastrin, and MSH Release Inhibiting Hormone.

Enzyme

A complex protein that living cells produce and which catalyzes specific biochemical reactions. There are six main types of enzymes, oxidoreductases, transferases, hydrolases, lyases, isomerases, and ligases. Examples include ATP Citrate Lyase, Acetyl CoA Acetyltransferase, Complement Activating Enzymes, and Glucose Oxidase.

Vitamin

A substance, usually an organic chemical complex, present in natural products or made synthetically, which is essential in the diet of humans or other higher animals. Included here are vitamin precursors and provitamins. Examples include Vitamin A, Ascorbic Acid, Biotin, Riboflavin, and 25-Hydroxyvitamin D 2.

Prostaglandin
A member of the group of physiologically active compounds derived from arachidonic acid. Members of the group play major roles in the reproductive process, smooth muscle stimulation, blood pressure levels, inflammation, etc. Included here are prostacyclins, thromboxanes, and leukotrienes. Examples include Alprostadil, Prostaglandins F, Thromboxane A2, and Rioprostil.

Immunologic Factor

A biologic factor whose activities affect or play a role in the functioning of the immune system. Examples include Autocrine Motility Factor, Antilymphocyte Globulin, HIV Antigens, and Hepatitis surface antigen.

Indicator or Reagent

A substance used in laboratory reactions, or laboratory or diagnostic tests and procedures to detect, measure, examine, or analyze other chemicals, processes, or conditions. Examples include Contrast Media, Buffers, Affinity Labels, and Dansyl Compounds.

Hazardous or Poisonous Substance

A substance of concern because of its potentially hazardous or toxic effects. This would include most drugs of abuse, as well as agents that require special handling because of their toxicity. Most pharmaceutical agents, although potentially harmful, we exclude here and assign to the type Pharmacologic Substance. Examples include Paraquat, Crack Cocaine, Plant poison, Carcinogens, and Sodium Cyanide.

5. Concepts and Ideas

Conceptual Entity

A broad type for grouping abstract entities or concepts. The children of this type in the network are Idea or Concept, Finding, Organism Attribute, Intellectual Product, Language, Occupation or Discipline, Organization, Group Attribute, and Group.

Idea or Concept

An abstract concept, such as a social, religious, or philosophical concept. The children of this type are Temporal Concept, Qualitative Concept, Quantitative Concept, Functional Concept, and Spatial Concept. Examples include Civil Rights, Freedom, Ethics, Spiritualism, and Capitalism.

Temporal Concept

A concept that pertains to time or duration. Examples include Half-Life, Postoperative Period, Puerperium, Birth Intervals, and Postimplantation Phase.

Qualitative Concept

A concept that is an assessment of some quality, rather than a direct measurement. Examples include Clinical Competence, Quality of Health Care, Abuse of Health Services, and Consumer Satisfaction.

Quantitative Concept

A concept that involves the dimensions, quantity or capacity of something using some unit of measure, or which involves the quantitative comparison of entities. Examples include Metric System, Body Height, Age Distribution, and Secretory Rate.

Spatial Concept

A location, region, or space, generally having definite boundaries. The children of this type are Body Space or Junction, Body Location or Region, Molecular Sequence, and Geographic Area.
Regulation or Law
An intellectual product resulting from legislative or regulatory activity. Examples include Building Codes, Criminal Law, Health Planning Guidelines, and Security Measures.

Group Attribute
A conceptual entity that refers to the frequency or distribution of certain characteristics or phenomena in certain groups. Examples include Neonatal Mortality, Life Expectancy, Family Size, Population Characteristics, and Group Structure.

Functional Concept
A concept that is of interest because it pertains to the carrying out of a process or activity. This type has one child in the network, Body System. Examples include Solar System.

Intellectual Product
A conceptual entity resulting from human endeavor. Terms assigned to this type generally refer to information created by humans for some purpose. This type has one child in the network, Regulation or Law. Examples include Bayes Theorem, Information Systems, and Literature.

Language
The system of communication used by a particular nation or people. Examples include Afrikaans, Greek, Modern, Braille, and Welsh.

6. Diseases and Pathologic Processes

Pathologic Function
A disordered process, activity, or state of the organism as a whole, of a body system or systems, or of multiple organs or tissues. Included here are normal responses to a negative stimulus as well as pathologic conditions or states that are less specific than a disease. Pathologic functions frequently have systemic effects. The children of this type are Disease or Syndrome, Cell or Molecular Dysfunction, and Experimental Model of Disease. Examples include Shock, Infarction, Cerebral Anoxia, Inflammation, Anaphylaxis, and Acid-Base Imbalance.

Disease or Syndrome
A condition that alters or interferes with a normal process, state, or activity of an organism. It is usually characterized by the abnormal functioning of one or more of the host's systems, parts, or organs. Included here is a complex of symptoms descriptive of a disorder. This type has one child in the network, Mental or Behavioral Dysfunction. Examples include Diabetes Mellitus, Brain Neoplasms, Nephrotic Syndrome, Dumping Syndrome, and Malabsorption Syndromes.

Mental or Behavioral Dysfunction
A clinically significant dysfunction whose major manifestation is behavioral or psychological. These dysfunctions may have identified or presumed biological etiologies or manifestations. Examples include Memory Disorders, Agoraphobia, Hallucinations, Anxiety States, Neurotic, and Cyclothymic Disorder.

Experimental Model of Disease
A representation in a non-human organism of a human disease for the purpose of research into its mechanism or treatment. Examples include Avian Leukosis, Streptozotocin Diabetes, Ehrlich Ascites Tumor, and Melanoma, Experimental.

Finding
That which is discovered by direct observation or measurement of an organism attribute or condition, including the clinical history of the patient. The children of this type are Laboratory or Test Result, and Sign or Symptom. Examples include Occupational problem, Birth History, and Downward displacement of diaphragm.

Laboratory or Test Result

The outcome of a specific test to measure an attribute or to determine the presence, absence, or degree of a condition. Laboratory or test results are inherently quantitative and, thus, we do not assign the additional type Quantitative Concept. Examples include Apgar Score, Gastric acidity, Blood Volume, and Hypernatremia.

Sign or Symptom

An observable manifestation of a disease or condition based on clinical judgment, or a manifestation of a disease or condition that the patient experiences and reports as a subjective observation. Examples include Pallor, Body Weight Changes, Echolalia, Hyperventilation, Pain, Toothache, Nausea, and Cough. Formerly semantic types Signs (# 35) and Symptoms (# 36).

Injury or Poisoning

A traumatic wound, injury, or poisoning caused by an external agent or force. Examples include Frostbite, Mushroom Poisoning, Acid burn, Snake Bites, and Ergotism.

7. Geographic Areas GEO

Geographic Area

A geographic location, generally having definite boundaries. Examples include Canada, Baltimore, Far East, Arctic Regions, and Cities.

8. Groups GRP

Group

A conceptual entity referring to the classification of individuals according to certain shared characteristics. The children of this type are Professional or Occupational Group, Population Group, Family Group, Age Group, and Patient or Disabled Group.

Professional or Occupational Group

An individual or individuals classified according to their vocation. Examples include Zoologist, Physicians, Hospital Volunteers, Clergy, Military Personnel, and Demographers.

Population Group

An individual or individuals classified according to their sex, racial origin, religion, common place of living, financial or social status, or some other cultural or behavioral attribute. Examples include Asian Americans, Ethnic Groups, Homeless Persons, and Low-Income Population.

Family Group

An individual or individuals classified according to their family relationships or relative position in the family unit. Examples include Only Child, Single Parent, Surrogate Mothers, and Twins.

Age Group

An individual or individuals classified according to their age. Examples include Adult, Infant, Premature, Adolescents, and Octogenarian.

Patient or Disabled Group
An individual or individuals classified according to a disability, disease, condition, or treatment. Examples include Amputees, Child, Institutionalized, and Inpatients.

Molecular Biology

Macromolecular Structure

A very large molecule whose structure contributes to the physiology of the cell. This type has one child in the network, Gene or Genome. Examples include Scleroproteins, Histone H5, and Collagen.

Gene or Genome

A specific sequence, or in the case of the genome the complete sequence, of nucleotides along a molecule of DNA or RNA (in the case of some viruses) which represent the functional units of heredity. Examples include Alleles, Genes, Structural, Genome, Human, and c-Ha-ras Genes.

Molecular Function

A physiologic function occurring at the molecular level. This type has one child in the network, Genetic Function. Examples include Electron Transport, Glycolysis, and Binding, Competitive.

Genetic Function

Functions of or related to the maintenance, translation, or expression of the genetic material. Examples include Amino Acid Activation, Early Gene Transcription, Gene Amplification, and RNA Splicing.

Cell or Molecular Dysfunction

A pathologic function inherent to cells, parts of cells, or molecules. Examples include Cellular necrosis, Wallerian Degeneration, Cell Transformation, Neoplastic, and DNA Damage.

Molecular Biology Research Technique

Any of the techniques used in the study of or the directed modification of the gene complement of a living organism. Examples include Genetic Engineering, Heterozygote Detection, Sequence Homology Determination, and Blotting, Northern.

Molecular Sequence

A broad type for grouping the collected sequences of amino acids, carbohydrates, and nucleotide sequences. Descriptions of these sequences are generally reported in the published literature and/or are deposited in and maintained by data banks such as GenBank, European Molecular Biology Laboratory (EMBL), National Biomedical Research Foundation (NBRF), or other sequence repositories. The children of this type are Nucleotide Sequence, Amino Acid Sequence, and Carbohydrate Sequence.

Nucleotide Sequence

The sequence of purines and pyrimidines in nucleic acids and polynucleotides. Included here are nucleotide-rich regions, conserved sequence, and DNA transforming region. Examples include AT Rich Region, Base Sequence, Direct Repeat, and Exons.

Amino Acid Sequence

The sequence of amino acids as arrayed in chains, sheets, etc., within the protein molecule. It is of fundamental importance in determining protein structure.

Carbohydrate Sequence

The sequence of carbohydrates within polysaccharides, glycoproteins, and glycolipids.
Nucleic Acid, Nucleoside, or Nucleotide

A complex compound of high molecular weight occurring in living cells. These are of two types, ribonucleic (RNA) and deoxyribo-nucleic (DNA) acids, both of which consist of nucleotides (nucleoside phosphates linked together by phosphate bridges). Examples include Adenosine, Dibutyril Cyclic AMP, Deoxyadenosines, and Nicotinamide Mononucleotide.

Amino Acid, Peptide, or Protein

Amino acids and chains of amino acids connected by peptide linkages. Examples include Glycoproteins, Myoglobin, Alanine, Sulfatase, and Acetylcysteine.

Gene Product

Formerly semantic type # 117.

10. Physical Objects

Entity

A physical or conceptual entity. The children of this type are Physical Object and Conceptual Entity.

Physical Object

An object perceptible to the sense of vision or touch. The children of this type in the network are Organism, Anatomical Structure, Manufactured Object, and Substance.

Manufactured Object

A physical object made by human beings. The children of this type in the network are Medical Device and Research Device. Examples include Cooking and Eating Utensils, Bookplates, Adhesive tape, and Car Seats.

Medical Device

A manufactured object used primarily in the diagnosis, treatment, or prevention of physiologic or anatomic disorders. Examples include Hip Prosthesis, Oxygenators, Syringes, and Obstetrical Forceps.

Research Device

A manufactured object used primarily in carrying out scientific research or experimentation. Examples include Questionnaires, Atmosphere Exposure Chambers, and Cell-Free System.

Substance

A material with definite or fairly definite chemical composition. The children of this type are Chemical, Body Substance, and Food. Examples include Charcoal, Foreign Bodies, Air, Fossils," and Electrons.

Food

Any substance containing nutrients, such as carbohydrates, proteins, and fats that a living organism can ingest and metabolize into energy and body tissue. Some foods are naturally occurring; others are either partially or entirely synthetic. Examples include Egg Yolk, Nuts, Beverages, and Margarine.

11. Occupations and Organizations

Occupation or Discipline
A vocation, academic discipline, or field of study, or a subpart of an occupation or discipline. If the term refers to the individuals who have the vocation, then we assign the type Professional or Occupational Group. This type has one child in the network, Biomedical Occupation or Discipline. Examples include Anthropology, Ecology, Linguistics, Air Microbiology, and Craniology.

Biomedical Occupation or Discipline

A vocation, academic discipline, or field of study related to biomedicine. Examples include Dermatology, Emergency Nursing, Dentistry, Family Practice, and Cellular Neurobiology.

Organization

The result of uniting for a common purpose or function. The continued existence of an organization is not dependent on any of its members, its location, or particular facility. Components or subparts of organizations are also included here. The children of this type are Health Care Related Organization, Professional Society, and Self-help or Relief Organization. Examples include Universities, United Nations, United States Environmental Protection Agency, European Economic Community, and Labor Unions.

Health Care Related Organization

An established organization which carries out specific functions related to health care delivery or research in the life sciences. Terms for health care related professional societies are assigned the type Professional Society. Examples include American Cancer Society Health Care Coalitions, Ambulatory Care Facilities, and Pan American Health Organization.

Professional Society

An organization uniting those who have a common vocation or who are involved with a common field of study. Examples include American Medical Association, Library Associations, and International Council of Nurses.

Self-help or Relief Organization

An organization whose purpose and function is to provide assistance to the needy or to offer support to those sharing similar problems. Examples include Alcoholics Anonymous, Red Cross, Charities, and Tuberculosis Societies.

12. Organism

Organism

Generally, a living individual, including all plants and animals. The children of this type are Plant, Fungus, Virus, Rickettsia or Chlamydia, Bacterium, and Animal. Examples include Plankton, Homozygote, and Radiation Chimera.

Plant

An organism having cellulose cell walls, growing by synthesis of inorganic substances, generally distinguished by the presence of chlorophyll, and lacking the power of locomotion. Plant parts are included here as well. This type has one child in the network, Alga. Examples include Potatoes, Pollen, and Vegetables.

Alga

A chiefly aquatic plant that contains chlorophyll, but does not form embryos during development and lacks vascular tissue. Examples include Chlorella, Laminaria, Seaweed, and Anabaena.

Fungus
A eukaryotic organism characterized by the absence of chlorophyll and the presence of a rigid cell wall. Included here are both slime molds and true fungi such as yeasts, molds, mildews, and mushrooms. Examples include Blastomyces, Neurospora, Aspergillus clavatus, and Helminthosporium.

Virus

An organism consisting of a core of a single nucleic acid enclosed in a protective coat of protein. A virus may replicate only inside a host living cell. A virus exhibits some but not all of the usual characteristics of living things. Examples include Paroviridae, Foot-and-Mouth Disease Virus, and Echovirus 6.

Rickettsia or Chlamydia

An organism intermediate in size and complexity between a virus and a bacterium, and which is parasitic within the cells of insects and ticks. Included here are all the chlamydias, also called PLT for psittacosis- lymphogranuloma venereum-trachoma. Examples include Anaplasma, Bartonella, and Chlamydia trachomatis.

Bacterium

A small, typically one-celled, prokaryotic micro-organism. Examples include Bacillus cereus, Acetobacter, Bordetella pertussis, and Cytophaga.

Animal

An organism with eukaryotic cells, and lacking stiff cell walls, plastids and photosynthetic pigments. The children of this type are Invertebrate and Vertebrate. Examples include Animals, Poisonous; Animals, Newborn; and Animals, Laboratory.

Invertebrate

An animal which has no spinal column. This type has no children in the network and is assigned to all invertebrate animals. Examples include Helminths, Octopus, Wasps, and Protozoa.

Vertebrate

An animal which has a spinal column. The children of this type are Amphibian, Bird, Fish, Reptile, and Mammal.

Amphibian

A cold-blooded, smooth-skinned vertebrate which characteristically hatches as an aquatic larva, breathing by gills. When mature, the amphibian breathes with lungs. Examples include Salamandra, Urodelia, and Frog.

Bird

A vertebrate having a constant body temperature and characterized by the presence of feathers. Examples include Canaries, Pigeons, and Quail.

Fish

A cold-blooded aquatic vertebrate characterized by fins and breathing by gills. Included here are fishes having either a bony skeleton, such as a perch, or a cartilaginous skeleton, such as a shark, or those lacking a jaw, such as a lamprey or hagfish. Examples include Bass, Eels, and Carp.

Reptile
A cold-blooded vertebrate having an external covering of scales or horny plates. Reptiles breathe by means of lungs and are generally egg-laying. Examples include Lizards, Snakes, Turtles, and Iguanas.

Mammal 15

A vertebrate having a constant body temperature and characterized by the presence of hair, mammary glands, and sweat glands. This type has one child in the network, Human. Examples include Bears, Macaca, Hamsters, and Kangaroos.

Human 16

Modern man, the only remaining species of the Homo genus. If a term describes a human being from the point of view of occupational, family, social status, etc., then a type from the Group hierarchy is assigned instead. A small number of terms have been assigned this type, e.g., Hominidae, Man, and Homo sapiens.

13. Physiology PHY

Biologic Function 38

A state, activity, or process of the body or one of its systems or parts. If the term refers to a biologic function found only in non-humans, the Non-Human flag is assigned as well. The children of this type are Physiologic Function and Pathologic Function.

Physiologic Function 39

A normal process, activity, or state of the body. The children of this type in the network are Organism Function, Organ or Tissue Function, Cell Function, and Molecular Function.

Organism Function 40

A physiologic function of the organism as a whole, of multiple organ systems, or of multiple organs or tissues. This type has one child in the network, Mental Process. Examples include Growth, Sleep, Hibernation, and Homeostasis.

Mental Process 41

A physiologic function involving the mind or cognitive processing. Examples include Avoidance Learning, Pattern Recognition, Anger, and Cognition."

Organ or Tissue Function 42

A physiologic function of a particular organ, organ system, or tissue. Examples include Osteogenesis, Tooth Calcification, and Renal Circulation.

Cell Function 43

A physiologic function inherent to cells or cell components. Examples include Cell Division, Cell Cycle, Erythrocyte Aggregation, and Lymphocyte Transformation.

Organism Attribute 32

A property of the organism or its major parts. If the term refers to an attribute found only in non-humans, the Non-Human flag is assigned as well. Examples include Body Weight, Body Temperature, Ambidexterity, and Eye Color.

14. Procedures PRO

Laboratory Procedure 59
A procedure, method, or technique used to determine the composition, quantity, or concentration of a specimen, which is carried out in a clinical laboratory. Included here are procedures which measure the times and rates of reactions. Examples include Radioimmunoassay, Legionella titer, Blood Protein Electrophoresis, and Spectrophotometry.

Diagnostic Procedure

A procedure, method, or technique used to determine the nature or identity of a disease or disorder. This excludes procedures which are primarily carried out on specimens in a laboratory. Examples include Electrocardiography, Ultrasonography, Heart Auscultation, and Personality Assessment.

Therapeutic or Preventive Procedure

A procedure, method, or technique designed to prevent a disease or a disorder, or to improve physical function, or used in the process of treating a disease or injury. Examples include Cesarean Section, Counseling, Vaccine Therapy, and Cochlear Implant.

15. Unknown/Untyped

Unknown/Untyped

A vocabulary concept where the semantic type is either unknown or by its recent addition to the vocabulary, remains untyped. Most untyped concepts acquire a semantic assignment by either further investigation or usage.

VERSION:

DESCRIPTION: File
TYPE: File

During the SQA of patch LEX*2.0*39, several anomalies were discovered with the Lexicon, CPT and ICD data files stemming from the Code Set Versioning and Code Text Descriptors projects. There were several identical fields identified by the cross-references, and a field that points to a non-existing file.

Rather than delete the DD and refresh it, potentially wiping out local mods, the Lexicon team is requesting a one-time permission to write and delete directly from the Data Dictionary.

The code is as follows:

1 File #757.28, Index "ACT" has duplicate Fields
   Field 01 ACTIVATION EFFECTIVE DATE

ROUTINE:

5038 LEXICON Read of ^DD(D0,0,'IX')
CUSTODIAL PACKAGE: VA FILEMAN
SUBSCRIBING PACKAGE: LEXICON UTILITY

Lexicon needs to be able to obtain the field number that contains a classic Fileman cross-reference by a direct global read of the Lexicon's Data Dictionary (DD) 0 node, 'IX' subscripts.

^DD(<file>,0,'IX',<file/sub-file>,<field>)

The Lexicon has become so large that conventional Re-indexing by Kill/Set logic needs to be replaced with Index Repair logic, avoiding the killing of a cross-reference and allowing users to stay on the system without loss of access to the Lexicon package.

USAGE: Private ENTERED: NOV 6, 2007
STATUS: Active EXPIRES: DURATION: Till Otherwise Agr VERSION:
FILE: ROOT: DD(^DD(D0,0,'IX'))

DD(D0,0,'IX') - Where D0 is the number of a Lexicon file, and the 'IX' subscript contains a listing of Lexicon fields that are cross-referenced.

5747 ICD Data Extraction ^ICDEX
CUSTODIAL PACKAGE: DRG GROUPER
SUBSCRIBING PACKAGE: LEXICON UTILITY

The LEXICON UTILITY has access to all APIs listed in this ICR as if it were the Custodial Package.

ACCOUNTS RECEIVABLE
The ACCOUNT RECEIVABLE (PRCA) package will use the following APIs:

$$CODEC^ICDEX to return the ICD code based on a file number and an Internal Entry Number (IEN).

$$CODECS^ICDEX to return the coding system based on a code in a file on a specified date.

INTEGRATED BILLING
INTEGRATED BILLING will use the following APIs

$$SYS^ICDEX to return the current diagnosis code coding system

$$CODEABA^ICDEX to return the IEN for a code in a specified coding system

$$STATCHK^ICDEX to return the status (active or inactive) of a code and the code's IEN for a code in
a specified coding system

FEE BASIS
The FEE BASIS package will use the following APIs:

$$\text{GETDRG}^\text{ICDEX}$$ to return the DRGs associated with a code and the fiscal year.

$$\text{STATCHK}^\text{ICDEX}$$ to return the status (active or inactive) of a code and the code's IEN for a code in a specified coding system

PROSTHETICS
PROSTHETICS (RMPR) will use the following APIs:

$$\text{SINFO}^\text{ICDEX}$$ to return basic information about the active coding system based on a Date of Service.

$$\text{CSI}^\text{ICDEX}$$ to return the coding system for an Internal Entry Number (IEN) to filter searches by coding system

$$\text{STATCHK}^\text{ICDEX}$$ to return the code status, IEN and the effective date of the status.

$$\text{ICDDX}^\text{ICDEX}$$ to return data about an ICD Diagnosis code.

$$\text{VLT}^\text{ICDEX}$$ to return the versioned long text (description) for either an ICD diagnosis or procedure.

$$\text{LS}^\text{ICDEX}$$ to return the last status based on date regardless of coding system.

$$\text{CODEC}^\text{ICDEX}$$ to return an ICD code based on file number and Internal Entry Number (IEN).

SCHEDULING
SCHEDULING (SD) will use the following APIs

$$\text{IMP}^\text{ICDEX}$$ to return the date a coding system was implemented. This date will be used as parameter of an input transformation when entering ICD codes.

$$\text{CSI}^\text{ICDEX}$$ to return the coding system based on an Internal Entry Number (IEN) used to identify commonly used ICD codes as either ICD-9 or ICD-10.

$$\text{VER}^\text{ICDEX}$$ to return either the current version, the next version or the previous version of the ICD coding system.

$$\text{SYS}^\text{ICDEX}$$ to return the current coding system based on a file number (80/80.1) and date.

$$\text{LS}^\text{ICDEX}$$ to return the last status based on date
regardless of coding system

$$ICDDX^ICDEX to return information about a diagnosis code

REGISTRATION
REGISTRATION (DG) will use the following APIs:

$$CSI^ICDEX to return the coding system based on an Internal Entry Number (IEN) used to identify ICD codes as either ICD-9 or ICD-10.

$$CODEC^ICDEX to return an ICD code based on file number and Internal Entry Number (IEN).

$$CODEN^ICDEX to return the Internal Entry Number (IEN) of a code based on a code and file number.

$$CODEABA^ICDEX to return the IEN for a code in a specified coding system (this is the preferred method of obtaining an IEN for a code)

$$LS^ICDEX to return the last status for an Internal Entry Number (IEN) based on a date.

$$NOT^ICDEX to return a list of codes not to be use with a code passed as a parameter.

$$REQ^ICDEX to return a list of codes required with a code passed as a parameter.

$$SYS^ICDEX to return a coding system based on the contents of the Coding System file 80.4, a mnemonic, a pattern match or a code

$$VLT^ICDEX to return the versioned long text (aka description) based on a file number, Internal Entry Number (IEN) and date.

$$SINFO^ICDEX to return basic information about the active coding system based on a Date of Service

CLINICAL REMINDERS
CLINICAL REMINDERS (PXRM) will use the following APIs:

$$CODEN^ICDEX to return the Internal Entry Number (IEN) of a code based on a code and file number

$$CODEABA^ICDEX to return the IEN for a code in a specified coding system (this is the preferred method of obtaining an IEN for a code)

$$ICDDX^ICDEX to return information about an ICD diagnosis code.

$$ICDOP^ICDEX to return information about an ICD
procedure code.

$$\texttt{NEXT}^\text{ICDEX}$$ to return the next code in a coding system.

$$\texttt{PREV}^\text{ICDEX}$$ to return the previous code in a coding system.

$$\texttt{IMP}^\text{ICDEX}$$ to return the implementation date of a coding system.

$$\texttt{ROOT}^\text{ICDEX}$$ to return the global root of a coding system.

$$\texttt{HDR}^\text{ICDEX}$$ to return the header nodes of files 80 and 80.1.

$$\texttt{CODEC}^\text{ICDEX}$$ to return the ICD code based on a file number and an Internal Entry Number (IEN)

$$\texttt{CSI}^\text{ICDEX}$$ to return the coding system for an Internal Entry Number (IEN) to filter searches by coding system

$$\texttt{SINFO}^\text{ICDEX}$$ to return basic information about the active coding system based on a Date of Service

PHARMACY BENEFITS MANAGEMENT

PHARMACY BENEFITS MANAGEMENT (PSU) will use the following APIs:

$$\texttt{CSI}^\text{ICDEX}$$ to return the coding system based on an Internal Entry Number (IEN) used to identify commonly used ICD codes as either ICD-9 or ICD-10.

$$\texttt{ICDDX}^\text{ICDEX}$$ to return information about an ICD diagnosis code.

$$\texttt{ICDOP}^\text{ICDEX}$$ to return information about an ICD procedure code.

CLINICAL CASE REGISTRIES

The CLINICAL CASE REGISTRIES (ROR) will use the following APIs:

$$\texttt{CSI}^\text{ICDEX}$$ to return the coding system for an Internal Entry Number (IEN) to filter searches by coding system

$$\texttt{VSEX}^\text{ICDEX}$$ to return the sex designation for a code.

$$\texttt{UPDX}^\text{ICDEX}$$ to determine if a code is unacceptable as a principle diagnosis.

$$\texttt{CODEC}^\text{ICDEX}$$ to return an ICD code based on file number and Internal Entry Number (IEN).
$CODEABA^ICDEX to return the IEN for a code in a specified coding system

$VSTD^ICDEX to return the Versioned Short Text for a diagnosis on a specified date.

$VLTD^ICDEX to return the Versioned Long Text for a diagnosis on a specified date.

$VSTP^ICDEX to return the versioned Short Text for a procedure on a specified date.

$VLTP^ICDEX to return the versioned Long Text for a procedure on a specified date.

$FILE^ICDEX to return a file number based on a coding system, global root, filename or file identifier.

$VLT^ICDEX to return the versioned long text (aka description) based on a file number, Internal Entry Number (IEN) and date.

$VST^ICDEX to return the versioned short text based on a file number, Internal Entry Number (IEN) and date.

$CODEN^ICDEX to return the Internal Entry Number (IEN) of a code based on a code and file number.

$ICDDX^ICDEX to return information about an ICD diagnosis code.

$ICDOP^ICDEX to return information about an ICD procedure code.

$SNAM^ICDEX to return the name of the coding system.

**CLINICAL PROCEDURES**

CLINICAL PROCEDURES (MD) will use the following APIs:

$ICDDX^ICDEX to return data about an ICD Diagnosis code.

$CSI^ICDEX to return the coding system for an Internal Entry Number (IEN) to filter searches by coding system.

$IMP^ICDEX to return the implementation date of a coding system.

$INFO^ICDEX to return basic information about the active coding system based on a Date of Service.

**SPINAL CORD DYSFUNCTION**

The SPINAL CORD DYSFUNCTION (SPN) package will use
the following APIs:

$$OBA^ICDEX$$ to replace cross-reference access to a specified code file.

$$CODEBA^ICDEX$$ to return the IEN of a code found in a specified code file.

$$CSI^ICDEX$$ to return the coding system based on an Internal Entry Number (IEN) used to identify commonly used ICD codes as either ICD-9 or ICD-10.

$$CODEABA^ICDEX$$ to return the IEN for a code in a specified coding system.

$$VLT^ICDEX$$ to return the Versioned Long Text for an diagnosis or procedure on a specified date.

$$VST^ICDEX$$ to return the Versioned Short Text for an diagnosis or procedure on a specified date.

HOSPITAL BASED HOME CARE
Home-Based Primary Care (HBH) will use the following API:

$$SYS^ICDEX$$ to return a coding system based on the contents of the Coding System file 80.4, a mnemonic, a pattern match or a code.

$$CODEC^ICDEX$$ to return an ICD code based on file number and Internal Entry Number (IEN).

$$VSTD^ICDEX$$ to return the Versioned Short Text for a diagnosis on a specified date.

$$SAI^ICDEX$$ to return the status, active date and inactive date based on a file, an Internal Entry Number (IEN) an a date.

$$CSI^ICDEX$$ to return the coding system for an Internal Entry Number (IEN) to filter searches by coding system.

EVENT CAPTURE
The EVENT CAPTURE (EC) package will use the following APIs:

$$SINFO^ICDEX$$ to return basic information about the active coding system based on a Date of Service.

$$ICDDX^ICDEX$$ to return data about an ICD Diagnosis code.

AUTOMATED INFO COLLECTION SYS
The AUTOMATED INFO COLLECTION SYS (IBD) package will use the following APIs:
\$\$SINFO^ICDEX to return basic information about the active coding system based on a Date of Service.

LAB SERVICE
The LAB SERVICES (LR) will use the following APIs:

\$\$CODEC^ICDEX to return the ICD code based on a file number and an Internal Entry Number (IEN).

\$\$ICDDX^ICDEX to return information about an ICD diagnosis code.

\$\$ICDOP^ICDEX to return information about an ICD procedure code.

\$\$IMP^ICDEX to return the implementation date of a coding system.

\$\$SINFO^ICDEX to return basic information about the active coding system based on a Date of Service.

\$\$CSI^ICDEX to return the coding system based on the internal entry number.

QUASAR
QUASAR (ACKQ) will use the following APIs:

\$\$CODEC^ICDEX to return the ICD code based on a file number and an Internal Entry Number (IEN).

\$\$CSI^ICDEX to return the coding system for an Internal Entry Number (IEN) to filter searches by coding system.

EMERGENCY DEPARTMENT
The EMERGENCY DEPARTMENT (EDP) package will use the following APIs:

\$\$ICDDX^ICDEX to return information about an ICD diagnosis code.

\$\$ICDOP^ICDEX to return information about an ICD procedure code.

PROBLEM LIST
PROBLEM LIST (GMPL) will use the following APIs:

\$\$CODEC^ICDEX to return the ICD code based on a file number and an Internal Entry Number (IEN).

\$\$SINFO^ICDEX to return basic information about the active coding system based on a Date of Service.

\$\$SDH^ICDEX to return a history of short descriptions for a file number and Internal Entry Number (IEN)

\$\$LDH^ICDEX to return a history of long descriptions
for a file number and Internal Entry Number (IEN)

USAGE: Controlled Subscri ENTERED: NOV 6,2011
STATUS: Pending EXPIRES:
DURATION: Till Otherwise Agr VERSION:
DESCRIPTION: TYPE: Routine

Application Programmer Interfaces (APIs) in this routine were developed to remove the need for direct global access to either the DIAGNOSIS file 80 or OPERATIONS/PROCEDURE file 80.1.

These entry points are meant to replace the following active/retired ICRs:

<table>

ROUTINE: ICDEX
COMPONENT: HELP
This is an interactive help entry point for the input and output variables for the APIs contained in the routine ICDEX.

COMPONENT: $ICDDX(CODE,CDT,SYS,FMT)
This entry point extracts data for an ICD-9 or ICD-10 code in the DIAGNOSIS file 80.

This entry point is intended to replace the ICD-9 Legacy API $ICDCODE (ICR 3990) and $ICDXCODE (ICR 5699), providing a single point of entry for ICD diagnostic data.

VARIABLES: Input CODE
This is an ICD diagnosis code in either the external or internal format. If the internal
format is used, then the input variable FMT must be set to "I" (Required).

VARIABLES: Input CDT
This is the Code Set Versioning date (Fileman format) used to identify the code and text that was appropriate for the date passed in this input parameter. (Optional, if not supplied, TODAY will be used)

VARIABLES: Input SYS
This is an ICD coding system identifier (taken from file 80.4). The following coding systems are found in file 80:

1 = ICD-9 Diagnosis
30 = ICD-10 Diagnosis

(Optional, but highly encouraged)

VARIABLES: Input FMT
This variable tells the API if the CODE is in External or Internal format.

"E" = External (default)
"I" = Internal Entry Number

(Conditional, required if CODE is in internal format)

VARIABLES: Output $$ICDDX
This is a 20 piece string delimited by "^

1  IEN of code in ^ICD9(^
2  ICD-9 Dx Code (#.01)
3  Identifier (#.1.2)
4  Versioned Dx (67 multiple)
5  Unacceptable as Principal Dx (#1.3)
6  Major Dx Cat (72 multiple)
7  MDC13 (#.4)
8  Compl/Comorb (103 multiple)
9  ICD Expanded (#1.7)
10 Status (66 multiple)
11 Sex (10 multiple)
12 Inactive Date (66 multiple)
13 MDC24 (#1.5)
14 MDC25 (#1.6)
15 Age Low (11 multiple)
16 Age High (12 multiple)
17 Activation Date (66 multiple)
18 Message
19 Complication/Comorbidity (103 multiple)
20 Coding System (#1.1)
21 Primary CC Flag (103 multiple)
22 PDX Exclusion Code (#1.11)

or
COMPONENT: $$ICDOP(CODE,CDT,SYS,FMT)
This entry point extracts data for an ICD-9 or ICD-10 code in
the OPERATIONS/PROCEDURE file 80.1

This entry point is intended to replace the ICD-9 Legacy API
$$ICDOP^ICDCODE (ICR 3990) and $$ICDDATA^ICDXCODE (ICR 5699),
providing a single point of entry for ICD procedural data.

VARIABLES: Input  CODE
This is an ICD operation/procedure code in either
the external or internal format. If the internal
format is used, then the input variable FMT must
be set to "I" (Required)

VARIABLES: Input  CDT
This is the Code Set Versioning date (Fileman
format) used to identify the code and text that
was appropriate for the date passed in CDT.
(Optional, if not supplied, TODAY will be used)

VARIABLES: Input  SYS
This is an ICD coding system identifier (taken
from file 80.4). The following coding systems are
found in file 80.1:

  2 = ICD-9 Procedures
  31 = ICD-10 Procedures

(Optional, but highly encouraged)

VARIABLES: Input  FMT
This variable tells the API if the CODE is in
External or Internal format.

    "E" = External (default)
    "I" = Internal Entry Number

(Conditional, required if CODE is in internal
format)

VARIABLES: Output  $$ICDOP
This is a 15 piece string delimited by ":^:

  1  IEN of code in ^ICD0(
  2  ICD procedure code    (#.01)
  3  Identifier           (#1.2)
  4  MDC24               (#1.5)
  5  Versioned Oper/Proc  (67 multiple)
  6  <null>
  7  <null>
  8  <null>
  9  ICD Expanded         (#1.7)
 10  Status               (66 multiple)
COMPONENT:  $$ICDD(CODE,.ARY,CDT,SYS,LEN)

This API returns the long description of either an ICD-9 or ICD-10 code.

This entry point is intended to replace the ICD-9 Legacy API $$ICDD^ICDCODE (ICR 3990) and $$ICDDDESC^ICDXCODE (ICR 5699), providing a single point of entry for ICD diagnosis/procedure descriptions.

VARIABLES:  Input     CODE
This is an ICD-9 or ICD-10 code in external format only  (Required).

VARIABLES:  Input     .ARY
This is the name of a local array, passed by reference that will contain the output of this API.  (Required)

VARIABLES:  Input     CDT
This is the Code Set Versioning date (Fileman format) used to identify the text that was appropriate for the date passed in this input parameter. (Optional, if not supplied, TODAY will be used)

VARIABLES:  Input     SYS
This is an ICD coding system identifier (taken from file 80.4). The following coding systems are found in files 80 and 80.1:

1 = ICD-9 Diagnosis file 80
2 = ICD-9 Procedure file 80.1
30 = ICD-10 Diagnosis file 80
31 = ICD-10 Procedure file 80.1

(Optional, but highly encouraged)

VARIABLES:  Input     LEN
This is the text string length of the description placed in array .ARY. (Optional, if passed it must be greater than 27 based on the longest word found in a diagnosis or procedure description and not greater than 245. If not passed it defaults to 245 characters based in the input transformation)

VARIABLES:  Output    $$ICDD
This is the number of lines in the output array .ARY or if an error occurs, -1*Error Message

VARIABLES: Output ARY

This is a local array, passed by reference, containing the long description of an ICD code with string lengths defined by LEN when passed or 245 characters. If there is a warning message about text accuracy (ICD-9 only) it will be appended to the end of the message preceded by a blank line.

ARY(1) - Description (length of LEN)
ARY(n) - Description (continued if necessary)

If there is a warning message (ICD-9 only):

ARY(n+1) - blank
ARY(n+2) - message: CODE TEXT MAY BE INACCURATE

COMPONENT: $$CODEN(CODE,FILE)
This API returns the Internal Entry Number (IEN) of a ICD code.

This entry point is intended to replace the ICD-9 Legacy API $$CODEN^ICDCODE (ICR 3990). It is also intended to replace the need for direct global access of the 'BA' cross-reference in ICRs 5388 and 5404.

VARIABLES: Input CODE
This is an ICD-9 or ICD-10 code in external format only (Required).

VARIABLES: Input FILE
This is the file number where the CODE is stored, either 80 or 80.1 (Required)

VARIABLES: Output $$CODEN
This is the Internal Entry Number (IEN) of CODE in file FILE appended by a tilde "~" and the global root FILE:

IEN~^ROOT

or -1*Error Message on error

COMPONENT: $$CODEC(FILE,IEN)
This entry point returns the ICD-9 or ICD-10 code from a specified ICD file and Internal Entry Number (IEN).

This entry point is intended to replace the ICD-9 Legacy API $$CODEC^ICDCODE (ICR 3990). It is also intended to replace the need for direct global access in ICRs 280, 365, 582, 5388, and 5404.

VARIABLES: Input FILE
This is the ICD file number used to retrieve the
code (Required)

80   = ICD Diagnosis file
80.1 = ICD Operation/Procedure file

VARIABLES: Input   IEN
This is the internal entry number in FILE were the code to be retrieved is stored (Required)

VARIABLES: Output   $$CODEC
This is either the ICD code stored at the Internal Entry Number IEN in the file identified by the FILE input parameter, or upon error:

   -1 ^ Error Message

COMPONENT: $$CODEBA(CODE,ROOT)
This entry point returns the internal entry number (IEN) of a code found in the 'BA' cross-reference in the file specified.

This entry point is provided in lieu of ICD-9 Legacy entry point $$CODEN^ICDCODE (ICR 3990) which will crash with a <MAXNUMBER> error if the code passed has the letter 'E' in the middle of the code (example, ICD-10 procedure code 041E499 would be interpreted as scientific notation). $$CODEBA^ICDEX is much safer.

If you already know the coding system, please use $$CODEABA^ICDEX instead.

This entry point replaces the need for direct global read access of the 'BA' cross-reference allowed by ICRs 5388 and 5404.

VARIABLES: Input   CODE
This is either an ICD Diagnosis code or ICD Procedure code (Required)

VARIABLES: Input   ROOT
This is the global root (or file number) where the code is stored (Required)

VARIABLES: Output   $$CODEBA
This is the internal entry number (IEN) in the specified file where the code is stored or -1 if not found.

COMPONENT: $$CODEABA(CODE,ROOT,SYS)
This entry point returns the internal entry number (IEN) of a code found in the system specific 'ABA' cross-reference in the file specified.

This entry point is provided in lieu of ICD-9 Legacy entry point $$CODEN^ICDCODE (ICR 3990) and new entry point $$CODEBA^ICDEX.

Entry point Comparison:
$$\text{CODEN}^*\text{ICD CODE}$$ will crash if the code has the letter 'E' in the middle of the code. Do not use it.

$$\text{CODEBA}^*\text{ICDEX}$$ is safer but it will fail to return the correct IEN if ICD-9 and ICD-10 ever have a similar code.

$$\text{CODEABA}^*\text{ICDEX}$$ will neither crash or fail to return the correct IEN.

VARIABLES: Input  
CODE
This is either an ICD Diagnosis code or ICD Procedure code (Required)

VARIABLES: Input  
ROOT
This is the global root (or file number) where the code is stored (Optional if SYS is supplied)

VARIABLES: Input  
SYS
This is an ICD coding system identifier (taken from file 80.4). The following coding systems are found in files 80 and 80.1:

1 = ICD-9 Diagnosis file 80
2 = ICD-9 Procedure file 80.1
30 = ICD-10 Diagnosis file 80
31 = ICD-10 Procedure file 80.1

This API will look for the code on one of the system specific cross-references:

^ICD9("ABA",1,CODE,IEN)   ICD-9 Diagnosis
^ICD9("ABA",30,CODE,IEN)  ICD-10 Diagnosis
^ICD0("ABA",2,CODE,IEN)   ICD-9 Procedure
^ICD0("ABA",31,CODE,IEN)  ICD-10 Procedure

If not supplied, the API will attempt to determine the system based on code and file.

(Optional, but highly encouraged)

VARIABLES: Output  $$\text{CODEABA}$$
This is the internal entry number (IEN) in the specified file where the code is stored or -1 if not found.

COMPONENT: $$\text{CODEFI(CODE)}$$
This entry point tries to resolve which file has an ICD code on file.

VARIABLES: Input  
CODE
This is either an ICD Diagnosis code or ICD Procedure code (Required)

VARIABLES: Output  $$\text{CODEFI}$$
This is the ICD file number where the specified code was found:

80 = ICD Diagnosis file
80.1 = ICD Operation/Procedure file

or NULL if not found or could not resolve to a single file.

COMPONENT:  $$CODECS(CODE,FILE,CDT)
This entry point tries to resolve the Coding System based on a code, a file and a date.

VARIABLES:  Input  CODE
This is either an ICD Diagnosis code or ICD Procedure code (Required)

VARIABLES:  Input  FILE
This is the ICD file number used to resolve the coding system:

80 = ICD Diagnosis file
80.1 = ICD Operation/Procedure file

(Optional, but encouraged) If not supplied, an attempt to resolve the input variable FILE will be made using the entry point $$CODEFI(CODE).

VARIABLES:  Input  CDT
This is the Code Set Versioning date (Fileman format) used to resolve the coding system.

This date is ONLY used if a code is found in both ICD-9 and ICD-10 systems. If that ever happens, the date passed will determine the coding system. If the date passed is before the ICD-10 implementatin date then it will be considered an ICD-9 code and if it is on or after the ICD-10 implementation date then it will be considered ICD-10.

VARIABLES:  Output  $$CODECS
This is a 2 piece "^" delimited string containing:

1   Coding System (pointer to file 80.4)
2   Coding Nomenclature (commonly used name)

Example output values:

1^ICD-9-CM
30^ICD-10-CM
2^ICD-9 Proc
31^ICD-10-PCS

NULL if the API cannot resolve the coding system based on code, file and date.
COMPONENT:  $$CSI(FILE,IEN)
This entry point returns the Coding System for an Internal
Entry Number (IEN).

VARIABLES:  Input     FILE
This is the ICD file number used to retrieve the
coding system (Required):

   80   = ICD Diagnosis file
   80.1 = ICD Operation/Procedure file

VARIABLES:  Input     IEN
This is an Internal Entry Number (IEN) in the file
specified (Required).

VARIABLES:  Output    $$CSI
This is a pointer to the ICD CODING SYSTEMS file
#80.4

COMPONENT:  $$VMDC(IEN,CDT,FMT)
This entry point retrieves the versioned Major Diagnostic
Category (MDC) for a diagnostic code in the DIAGNOSIS file 80.

VARIABLES:  Input     IEN
This is an Internal Entry Number (IEN) in the
DIAGNOSIS file 80 (Required)

VARIABLES:  Input     CDT
This is the Code Set Versioning date (Fileman
format) used to identify the Major Diagnostic
Category that was appropriate for the date passed
(Optional, if not passed TODAY is used).

VARIABLES:  Input     FMT
This is a flag used to determine the output
format. Acceptable values are 0 and 1 (Optional,
default value is 0).

   FMT = 0    Major Diagnostic Category (MDC)
   FMT = 1    MDC^Effective Date

VARIABLES:  Output    $$VMDC
This is the Major Diagnostic Category (MDC) that
was appropriate for the date passed and the
diagnosis code identified by input parameter IEN.
The output may also have a second "^" delimited
piece containing the MDC Effective Date if the
input parameter FMT is set to 1.

COMPONENT:  $$VAGEL(IEN,CDT,FMT)
This entry point retrieves the versioned Age Low value for a
diagnostic code in the DIAGNOSIS file 80. Age Low is the
minimum age value for an age range for which the diagnostic
code can be applied.

VARIABLES:  Input     IEN
This is an Internal Entry Number (IEN) in the
VARIABLES: Input  
CDT
This is the Code Set Versioning date (Fileman format) used to identify the Age Low value that was appropriate for the date passed (Optional, if not passed TODAY is used).

VARIABLES: Input  
FMT
This is a flag used to determine the output format. Acceptable values are 0 and 1 (Optional, default value is 0).

\begin{align*}
FMT = 0 & \quad \text{Age Low} \\
FMT = 1 & \quad \text{Age Low^Effective Date}
\end{align*}

VARIABLES: Output  
$$VAGEL$$
This is the Age Low that was appropriate for the date passed and the diagnosis code identified by the input parameter IEN. The output may also have a second "^" delimited piece containing the Age Low Effective Date if the input parameter FMT is set to 1. Null if Age Low not found for date.

COMPONENT:  $$VAGEH(IEN,CDT,FMT)$$
This entry point retrieves the versioned Age High value for a diagnostic code in the DIAGNOSIS file 80. Age High is the maximum age value for an age range for which the diagnostic code can be applied.

VARIABLES: Input  
IEN
This is an Internal Entry Number (IEN) in the DIAGNOSIS file 80 (Required)

VARIABLES: Input  
CDT
This is the Code Set Versioning date (Fileman format) used to identify the Age High value that was appropriate for the date passed (Optional, if not passed TODAY is used).

VARIABLES: Input  
FMT
This is a flag used to determine the output format. Acceptable values are 0 and 1 (Optional, default value is 0).

\begin{align*}
FMT = 0 & \quad \text{Age High} \\
FMT = 1 & \quad \text{Age High^Effective Date}
\end{align*}

VARIABLES: Output  
$$VAGEH$$
This is the Age High that was appropriate for the date passed and the diagnosis code identified by the input parameter IEN. The output may also have a second "^" delimited piece containing the Age High Effective Date if the input parameter FMT is set to 1. Null if Age High is not found for date.

COMPONENT:  $$VCC(IEN,CDT,FMT)$$
This entry point retrieves the versioned Complication Comorbidity (CC) designation for a diagnostic code in the DIAGNOSIS file 80. A diagnostic code can be designated as:

- Non-Complication Comorbidity (Non-CC)
- Complication Comorbidity (CC)
- Major Complication Comorbidity (MCC)

**VARIABLES:**

**Input IEN**
This is an Internal Entry Number (IEN) in the DIAGNOSIS file 80 (Required).

**Input CDT**
This is the Code Set Versioning date (Fileman format) used to identify the CC designation value that was appropriate for the date passed (Optional, if not passed TODAY is used).

**Input FMT**
This is a flag used to determine the output format. Acceptable values are 0 and 1 (Optional, default value is 0).

- FMT = 0    CC designation
- FMT = 1    CC designation^Effective Date

**Output $$VCC**
This is the CC designation that was appropriate for the date passed and the diagnosis code identified by the input parameter IEN. The output may also have a second "^" delimited piece containing the CC designation Effective Date if the input parameter FMT is set to 1.

- 0 = Non-Complication Comorbidity (Non-CC)
- 1 = Complication Comorbidity (CC)
- 2 = Major Complication Comorbidity (MCC)

Null if not found for date

**COMPONENT:** $$VSEX(FILE,IEN,CDT,FMT)**
This entry point retrieves the versioned sex designation for a diagnostic or procedure code in either the ICD DIAGNOSIS file 80 or the ICD OPERATION/PROCEDURE file 80.1. If a sex designation exist then the diagnosis or procedure should be applied only to that sex.

**VARIABLES:**

**Input FILE**
This is the ICD file number used to retrieve the sex designation:

- 80 = ICD Diagnosis file
- 80.1 = ICD Operation/Procedure file

**Input IEN**
This is an Internal Entry Number (IEN) in either the DIAGNOSIS file 80 or OPERATION/PROCEDURE file
80.1 (Required)

VARIABLES: Input CDT
This is the Code Set Versioning date (Fileman format) used to identify the sex designation value that was appropriate for the date passed (Optional, if not passed TODAY is used).

VARIABLES: Input FMT
This is a flag used to determine the output format. Acceptable values are 0 and 1 (Optional, default value is 0).

FMT = 0  Sex designation
FMT = 1  Sex designation^Effective Date

VARIABLES: Output $$VSEX
This is the sex designation that was appropriate for the date passed and the code identified by the input parameter IEN. The output may also have a second "^" delimited piece containing the sex designation Effective Date if the input parameter FMT is set to 1.

M = Male
F = Female
Null if sex is N/A or not found for date

COMPONENT: $$SAI(FILE, IEN, CDT)
This entry point retrieves the Status, Activation date and Inactivation date for a diagnosis or procedure on a specified date.

VARIABLES: Input FILE
This is the ICD file number used to retrieve the status and effective dates:

80 = ICD Diagnosis file
80.1 = ICD Operation/Procedure file

VARIABLES: Input IEN
This is an Internal Entry Number (IEN) in either the DIAGNOSIS file 80 or OPERATION/PROCEDURE file 80.1 (Required)

VARIABLES: Input CDT
This is the Code Set Versioning date (Fileman format) used to retrieve the status and effective dates that were appropriate for the date passed (Optional, if not passed TODAY is used).

VARIABLES: Output $$SAI
This is a 6 piece "^" delimited string

1  Status
2  Activation Date
3  Inactivation Date
4 IEN
5 Code
6 Short Text

If the status is active, the short text will be the most recent.

If the status is inactive, the short text will be the text in use on the date it was inactivated.

Null if no status for date.

COMPONENT: $$VST(FILE,IEN,CDT)
This entry point retrieves the Versioned Short Text for an diagnosis or procedure on a specified date.

VARIABLES: Input     FILE
This is the ICD file number used to retrieve the Versioned Short Text:

70 = ICD Diagnosis file
80.1 = ICD Operation/Procedure file

VARIABLES: Input     IEN
This is an Internal Entry Number (IEN) in either the DIAGNOSIS file 80 or OPERATION/PROCEDURE file 80.1 (Required)

VARIABLES: Input     CDT
This is the Code Set Versioning date (Fileman format) used to retrieve the Versioned Short Text that was appropriate for the date passed (Optional, if not passed TODAY is used).

VARIABLES: Output    $$VST
This is the Versioned Short Text from either file 80 (DIAGNOSIS) or 80.1 (OPERATION/PROCEDURE) that was appropriate for the date passed and the code identified by the input parameter IEN. Null if not found.

COMPONENT: $$VLT(FILE,IEN,CDT)
This entry point retrieves the Versioned Long Text (description) for a diagnosis or procedure on a specified date.

VARIABLES: Input     FILE
This is the ICD file number used to retrieve the Versioned Long Text (description):

70 = ICD Diagnosis file
80.1 = ICD Operation/Procedure file

VARIABLES: Input     IEN
This is an Internal Entry Number (IEN) in either the DIAGNOSIS file 80 or OPERATION/PROCEDURE file
80.1 (Required)

VARIABLES: Input  CDT
   This is the Code Set Versioning date (Fileman format) used to retrieve the Versioned Long Text (description) that was appropriate for the date passed (Optional, if not passed TODAY is used).

VARIABLES: Output  $$VLT
   This is the Versioned Long Text (description) from either file 80 or 80.1 that was appropriate for the date passed and the code identified by the input parameter IEN. Null if not found.

COMPONENT: $$VSTD(IEN,CDT)
   This entry point retrieves the Versioned Short Text for a diagnosis on a specified date.

VARIABLES: Input  IEN
   This is an Internal Entry Number (IEN) in the DIAGNOSIS file 80 (Required)

VARIABLES: Input  CDT
   This is the Code Set Versioning date (Fileman format) used to retrieve the Versioned Short Text that was appropriate for the date passed (Optional, if not passed TODAY is used).

VARIABLES: Output  $$VSTD
   This is the Versioned Short Text from file 80 that was appropriate for the date passed and the code identified by the input parameter IEN. Null if not found.

COMPONENT: $$VSTP(IEN,CDT)
   This entry point retrieves the Versioned Short Text for a procedure on a specified date.

VARIABLES: Input  IEN
   This is an Internal Entry Number (IEN) in the OPERATION/PROCEDURE file 80.1 (Required)

VARIABLES: Input  CDT
   This is the Code Set Versioning date (Fileman format) used to retrieve the Versioned Short Text that was appropriate for the date passed (Optional, if not passed TODAY is used).

VARIABLES: Output  $$VSTP
   This is the Versioned Short Text from file 80.1 that was appropriate for the date passed and the code identified by the input parameter IEN. Null if not found.

COMPONENT: $$VLTD(IEN,CDT)
   This entry point retrieves the Versioned Long Text (description) for a diagnosis on a specified date.
VARIABLES: Input IEN
This is an Internal Entry Number (IEN) in the DIAGNOSIS file 80 (Required)

VARIABLES: Input CDT
This is the Code Set Versioning date (Fileman format) used to retrieve the Versioned Long Text (description) that was appropriate for the date passed (Optional, if not passed TODAY is used).

VARIABLES: Output $$VLTD
This is the Versioned Long Text (description) from file 80 that was appropriate for the date passed and the code identified by the input parameter IEN. Null if not found.

COMPONENT: $$VLTP(IEN,CDT)
This entry point retrieves the Versioned Long Text (description) for a procedure on a specified date.

VARIABLES: Input IEN
This is an Internal Entry Number (IEN) in the OPERATION/PROCEDURE file 80.1 (Required)

VARIABLES: Input CDT
This is the Code Set Versioning date (Fileman format) used to retrieve the Versioned Long Text (description) that was appropriate for the date passed (Optional, if not passed TODAY is used).

VARIABLES: Output $$VLTP
This is the Versioned Long Text (description) from file 80.1 that was appropriate for the date passed and the code identified by the input parameter IEN. Null if not found.

COMPONENT: $$SD(FILE,IEN,CDT,.ARY,LEN)
This entry point retrieves the Versioned Short Text for a procedure on a specified date. This entry point is similar to $$VST except you can elect to have the Short Text returned in a local array and you can specify the string lengths of the text in the array.

VARIABLES: Input FILE
This is the ICD file number used to retrieve the Versioned Short Text (Required):

    80 = ICD Diagnosis file
    80.1 = ICD Operation/Procedure file

VARIABLES: Input IEN
This is an internal entry number (IEN) in either file 80 or 80.1 (Required)

VARIABLES: Input CDT
This is the Code Set Versioning date (Fileman
format) used to retrieve the Versioned Short Text that was appropriate for the date passed (Optional, If not passed TODAY is used).

VARIABLES: Input .ARY
This is a local array name passed by reference that will contain the Short Text output.

VARIABLES: Input LEN
This is a number greater than 27 and less than 246 representing the desired text string lengths for the Short Text output. If specified, the output will be parsed into strings not to exceed the length specified (Optional, default 245)

VARIABLES: Output $$SD
This is the Versioned Short Text from either file 80 or 80.1 that was appropriate for the date passed and the code identified by the input parameter IEN. If not found:

-1^Error Message

VARIABLES: Output ARY
If passed, this is a local array containing the number of text lines, the effective date of the Short Text and the text. If the input parameter LEN (length) is specified and the length is shorter than the Short Text, then the Short Text will be parsed into test strings not to exceed LEN.

ARY(0)=# lines ^ effective date
ARY(1)=Short Text

LEN is defined shorter than text

ARY(0)=# lines ^ effective date
ARY(1)=String length not to exceed LEN
ARY(n)=String length not to exceed LEN

Null if not found

COMPONENT: $$LD(FILE,IEN,CDT,.ARY,LEN)
This entry point retrieves the Versioned Long Text (description) for a procedure on a specified date. This entry point is similar to $$$VLT except you can elect to have the Long Text (description) returned in a local array and you can specify the string lengths of the text in the array.

VARIABLES: Input FILE
This is the ICD file number used to retrieve the Versioned Long Text (description) (Required):

80 = ICD Diagnosis file
80.1 = ICD Operation/Procedure file
VARIABLES: Input  IEN
This is an internal entry number (IEN) in either file 80 or 80.1 (Required)

VARIABLES: Input  CDT
This is the Code Set Versioning date (Fileman format) used to retrieve the Versioned Long Text (description) that was appropriate for the date passed (Optional, If not passed TODAY is used).

VARIABLES: Input  .ARY
This is a local array name passed by reference that will contain the Long Text (description) output.

VARIABLES: Input  LEN
This is a number greater than 27 and less than 246 representing the desired text string lengths for the Long Text (description) output. If specified, the output will be parsed into strings not to exceed the length specified (Optional, default 245)

VARIABLES: Output  $$LD
This is the Versioned Long Text (description) from either file 80 or 80.1 that was appropriate for the date passed and the code identified by the input parameter IEN. If not found:

-1^Error Message

VARIABLES: Output  ARY
If passed, this is a local array containing the number of text lines, the effective date of the Long Text (description) and the text. If the input parameter LEN (length) is specified and the length is shorter than the Long Text (description), then the Long Text (description) will be parsed into test strings not to exceed LEN.

ARY(0)=# lines ^ effective date
ARY(1)=Long Text (description)
LEN defined shorter than text

ARY(0)=# lines ^ effective date
ARY(1)=String length not to exceed LEN
ARY(n)=String length not to exceed LEN

COMPONENT: PAR(.ARY,LEN)
This entry point takes text in a local array (passed by reference) and parses it into string lengths not to exceed the length specified.

VARIABLES: Input  .ARY
This is a local array name passed by reference and
contains the text to be parsed into strings not to exceed the length specified.

ARY(1) = Unparsed Text

VARIABLES: Input LEN
This is a number representing the desired text string lengths for the text found in ARY(). (Optional, default length 79)

VARIABLES: Output ARY
This is a local array containing the input text parsed so that each text string length does not exceed the length specified.

ARY(1)=Parsed Text length not to exceed LEN
ARY(n)=Parsed Text length not to exceed LEN

COMPONENT: $$STATCHK(CODE,CDT,SYS)
This entry point is used to determine the status (active or inactive) of a ICD code.

VARIABLES: Input CODE
This is either an ICD diagnosis or procedure code (external format) (Required)

VARIABLES: Input CDT
This is the Code Set Versioning date (Fileman format) used to retrieve the code's status, internal entry number (IEN) and effective date that was appropriate for the date passed (Optional, If not passed TODAY is used)

VARIABLES: Input SYS
This is an ICD coding system identifier (taken from file 80.4). The following coding systems are found in files 80 and 80.1:

1 = ICD-9 Diagnosis
30 = ICD-10 Diagnosis
2 = ICD-9 Procedures
31 = ICD-10 Procedures

(Optional, but encouraged, if doesn't exist it will try to determine coding system by input parameter CODE)

VARIABLES: Output $$STATCHK
This is a three piece "^" delimited string

1 Status 1 = Active, 0 = Inactive
2 IEN or -1 on error
3 Effective Date or error message

Error 0 ^ -1 ^ Error message
Active Code 1 ^ IEN ^ Effective Date
Inactive Code 0 ^ IEN ^ Effective Date
COMPONENT: $$DTBR(CDT,STD,SYS)
This entry point returns the business rule date for a coding
system. This is in earliest date possible for a coding
standard and/or a coding system.

VARIABLES: Input  CDT
This is the Code Set Versioning date (Fileman
format) used to resolved the business rule date.
(Optional, if not passed TODAY is used)

VARIABLES: Input  STD
This is a coding standard from a Standards
Development Organization (SDO). A standard may
have one or more coding systems. (Optional,
default is 0)

0 = ICD (Default)
1 = CPT/HCPCS
2 = DRG

VARIABLES: Input  SYS
This is an ICD coding system identifier (taken
from file 80.4). (Optional, there is no default
value for this parameter, if it does not exist
then it is not used)

The following coding systems are found in files 80
and 80.1:

1 = ICD-9 Diagnosis
30 = ICD-10 Diagnosis
2 = ICD-9 Procedures
31 = ICD-10 Procedures

VARIABLES: Output  $$DTBR
Date adjusted by business rules:

If Standard (SDT) = 0 (ICD)

If CDT < 2781001 use 2781001
If CDT < 3131001 and SYS=30, use 3131001
If CDT < 3131001 and SYS=31, use 3131001

If Standard (SDT) = 1 (CPT/HCPCS)

If CDT < 2890101 use 2890101

If Standard (SDT) = 2 (DRG)

If CDT < 2821001 use 2821001

If CDT is year only, use first of the year If CDT
is year and month only, use first of the month

COMPONENT: $$IMP(SYS,CDT)
This entry point returns the date a coding system was
VARIABLES: Input SYS
This is a coding system (taken from file 80.4) or a coding system identifier that can be resolved to a coding system.

1 = ICD-9-CM
2 = ICD-9-PCS
30 = ICD-10-CM
31 = ICD-10-PCS

DX, DIAG, 80, ^ICD9(

1 = ICD-9-CM if CDT is before the ICD-10 implementation date
30 = ICD-10-CM if CDT is on or after the ICD-10 implementation date

PR, PROC, OPER, 80.1, ^ICD0(

2 = ICD-9-CM if CDT is before the ICD-10 implementation date
31 = ICD-10-CM if CDT is on or after the ICD-10 implementation date

VARIABLES: Input CDT
This is the Code Set Versioning date (Fileman format) used to resolve the coding system parameter SYS (Optional, if not passed TODAY is used)

VARIABLES: Output $$IMP
This is the date that a coding system identified by the input parameters SYS and CDT was implemented in Fileman format or on error:

-1 ^ Error message

COMPONENT: $$MSG(CDT,STD,SYS)
This entry point returns a warning message that the text may be inaccurate for the date specified. It applies only to ICD-9 Diagnosis and Procedures.

VARIABLES: Input CDT
This is the Code Set Versioning date (Fileman format) used to determine the accuracy of the text being returned (Optional, if not passed TODAY is used)

VARIABLES: Input STD
This is a coding standard from a Standards Development Organization (SDO). A standard may have one or more coding systems. (Optional, default is 0)

0 = ICD (Default)
1 = CPT/HCPCS  
2 = DRG

VARIABLES: Input SYS
This is an ICD coding system identifier (taken from file 80.4). (Optional, there is no default value for this parameter, if it does not exist then it is not used)

The following coding systems are found in files 80 and 80.1:

1 = ICD-9 Diagnosis  
30 = ICD-10 Diagnosis  
2 = ICD-9 Procedures  
31 = ICD-10 Procedures

VARIABLES: Output $$MSG
If coding system is not ICD-10 and the date passed is before the Code Set Versioning project Oct 1, 2002, then this variable is set to the warning message, "CODE TEXT MAY BE INACCURATE" otherwise it is null.

COMPONENT: $$SEL(FILE, IEN)
This entry point determines if an entry in a file is selectable by calling applications.

VARIABLES: Input FILE
This is an ICD file number:

80   = ICD Diagnosis file  
80.1 = ICD Operation/Procedure file

VARIABLES: Input IEN
This is an Internal Entry Number (IEN) in the file specified.

VARIABLES: Output $$SEL
This is a Boolean value:

1  Entry IEN in file FILE is Selectable
0  Entry IEN in file FILE is NOT Selectable

or

-1  on error

COMPONENT: $$NEXT(CODE, SYS, CDT)
This entry point returns the Next code in a sequence of codes in a coding system.

VARIABLES: Input CODE
This is either an ICD diagnosis, an ICD procedure code or null to retrieve the first code in a sequence.
This is an ICD coding system identifier (taken from file 80.4). (Optional)

The following coding systems are found in ICD files 80 and 80.1:

1 = ICD-9 Diagnosis
30 = ICD-10 Diagnosis
2 = ICD-9 Procedures
31 = ICD-10 Procedures

This is the Code Set Versioning date (Fileman format) used to determine the next code being returned (Optional, there is no default value for this parameter)

If CDT date is not passed then this entry point will return the next code, regardless of status (active or inactive)

If CDT date is passed then this entry point will return the next active code.

This is the next code in a sequence of codes. If the input code is null, then it will return the first code of the sequence of codes. If a date is passed in the input parameter CDT, then it will return the next active code in a sequence of codes.

This entry point returns the Previous code in a sequence of codes in a coding system.

This is either an ICD diagnosis, an ICD procedure code or null to retrieve the last code in a sequence.

This is an ICD coding system identifier (taken from file 80.4). (Optional)

The following coding systems are found in ICD files 80 and 80.1:

1 = ICD-9 Diagnosis
30 = ICD-10 Diagnosis
2 = ICD-9 Procedures
31 = ICD-10 Procedures

This is the Code Set Versioning date (Fileman format) used to determine the Previous code being
returned (Optional, there is no default value for this parameter)

If CDT date is not passed then this entry point will return the previous code, regardless of status (active or inactive)

If CDT date is passed then this entry point will return the previous active code.

VARIABLES: Output $$PREV
This is the previous code in a sequence of codes. If the input code is null, then it will return the last code of the sequence of codes. If a date is passed in the input parameter CDT, then it will return the previous active code in a sequence of codes.

COMPONENT: $$HIST(CODE,.ARY,SYS)
This entry point returns a code's activation history.

VARIABLES: Input CODE
This is an ICD diagnosis or procedure code.

VARIABLES: Input .ARY
This is a local array name passed by reference that will contain the code's activation history.

VARIABLES: Input SYS
This is an ICD coding system identifier (taken from file 80.4). (Optional)

The following coding systems are found in ICD files 80 and 80.1:

1 = ICD-9 Diagnosis
30 = ICD-10 Diagnosis
2 = ICD-9 Procedures
31 = ICD-10 Procedures

VARIABLES: Output $$HIST
This is set equal to the number of history entries in the local array ARY or -1 if there is an error or the code is not found.

VARIABLES: Output ARY
This is a local array containing the history records

ARY(0) = Number of History Entries
ARY(<effective date>) = status
ARY("IEN") = <ien>

COMPONENT: $$PERIOD(CODE,.ARY,SYS)
This entry point returns all the activation periods for a code. An activation period is defined as the period of time between the beginning activation effective date and the ending
inactivation effective date. If the code is still active the period will have an activation date without an inactivation date.

VARIABLES: Input CODE
This is either an ICD diagnosis or procedure code.

VARIABLES: Input .ARY
This is a local array name passed by reference that will contain the code's activation periods.

VARIABLES: Input SYS
This is an ICD coding system identifier (taken from file 80.4). (Optional)

The following coding systems are found in ICD files 80 and 80.1:

1 = ICD-9 Diagnosis
30 = ICD-10 Diagnosis
2 = ICD-9 Procedures
31 = ICD-10 Procedures

VARIABLES: Output $$PERIOD
This is a 2 piece "^" delimited string if successful and 3 piece "^" delimited string if unsuccessful or error.

1 IEN of code
2 Code is selectable (boolean 1/0)

or on error

-1 ^ 0 ^ Error Message

VARIABLES: Output ARY
This is a local array containing the Periods of activation for the code

ARY(0)

This is a 2 piece "^" delimited string if successful and a 3 piece "^" delimited string if unsuccessful or error.

1 IEN of code
2 Code is selectable (boolean 1/0)

or on error

-1^0^Error Message

ARY(Activation Date) = Inactivation Date^Short Name

Where the Short Name is the Versioned text, and the
COMPONENT: \$$OBA(FILE,CODE,SYS,REV)

This entry point is used to $ORDER through the BA or ABA cross-references and replaces the need to access the BA/ABA cross-references in a FOR loop. This entry point is meant to replace BA cross-reference in ICRs 5388 and 5404.

\$$OBA(<file>,<code>,<system>) replaces:

\$O("^ICD9("BA",(<code>_ " ")) and
\$O("^ICD0("BA",(<code>_ " "))

Examples:

F S CODE=\$$OBA(80,CODE,1) Q:'$L(CODE) D
F S CODE=\$$OBA(80,CODE,30) Q:'$L(CODE) D
F S CODE=\$$OBA(80.1,CODE,2) Q:'$L(CODE) D
F S CODE=\$$OBA(80.1,CODE,31) Q:'$L(CODE) D

VARIABLES: Input FILE

This is the ICD file number used to determine the global root to $ORDER through (Required):

80   = ICD Diagnosis file
80.1 = ICD Operation/Procedure file

VARIABLES: Input CODE

This is either an ICD diagnosis or procedure code to $ORDER from (required):

\$O("^ROOT("BA",(CODE_ " "))
\$O("^ROOT("ABA",SYS,(CODE_ " "))

VARIABLES: Input SYS

This is either an ICD diagnosis or procedure

This is an ICD coding system identifier (taken from file 80.4). (Optional)

The following coding systems are found in ICD files 80 and 80.1:

1 = ICD-9 Diagnosis
30 = ICD-10 Diagnosis
2 = ICD-9 Procedures
31 = ICD-10 Procedures

If the coding system can be identified then the "BA" cross-reference is ignored and the $ORDER will be performed on the "ABA" cross-reference:

\$O("^ROOT("ABA",SYS,(CODE_ " "))

VARIABLES: Input REV

This is the ICD file revision number
The "ABA" cross-reference is a coding system specific cross-reference.

VARIABLES: Used REV
This is a Reverse $ORDER flag, if set to 1, the $ORDER operation will be in the reverse direction of "BA" or "ABA" cross-reference (Optional, default is 0, $ORDER forward)

If equal to 1

\[ \$O(\text{"ROOT"("BA",(CODE_" ")}),-1) \]
\[ \$O(\text{"ROOT"("ABA",SYS,(CODE_" ")}),-1) \]

VARIABLES: Output $$OBA
This is the Next or Previous Code in the "BA" or "ABA" cross-reference depending on the $ORDER direction established by the input parameter REV.

COMPONENT: $$OD(FILE,WORD,SYS,REV)
This entry point is used to $ORDER through the "D" or "AD" cross-reference and replaces the need to access the D/AD cross-references in a FOR loop. This entry point is meant to replace the D cross-reference in ICRs 5388 and 5404.

$$OD(<file>,<word>,<system>) replaces:

\[ \$O(^\text{ICD9("D",(<word>_" ")}) \]
\[ \$O(^\text{ICD0("D",(<word>_" ")}) \]

Examples:

F S WORD=$$OD(80,WORD,1) Q:'$L(WORD) D
F S WORD=$$OD(80,WORD,30) Q:'$L(WORD) D
F S WORD=$$OD(80.1,WORD,2) Q:'$L(WORD) D
F S WORD=$$OD(80.1,WORD,31) Q:'$L(WORD) D

VARIABLES: Input FILE
This is the ICD file number used to determine the global root to $ORDER through (Required):

80 = ICD Diagnosis file
80.1 = ICD Operation/Procedure file

VARIABLES: Input WORD
This is a one or two piece "^" delimited string

1 WORD This is a single word parsed from the codes description.

2 IEN This is the internal entry number where the description can be found that contains the parsed word

WORD and IEN can be null.

$$OD $ORDER through "WORD^IEN" on either the D or
AD cross-references

Coding System unknown: \$O(^\text{ROOT}("D",\text{WORD},\text{IEN}))
Coding System known:
\$O(^\text{ROOT}("AD",\text{SYS},\text{WORD},\text{IEN}))

**VARIABLES:** Input SYS

This is an ICD coding system identifier (taken from file 80.4). (Optional)

The following coding systems are found in ICD files 80 and 80.1:

- 1 = ICD-9 Diagnosis
- 30 = ICD-10 Diagnosis
- 2 = ICD-9 Procedures
- 31 = ICD-10 Procedures

If the coding system can be identified then the"D" cross-reference is ignored and the $ORDER will be performed on the "AD" cross-reference:

\$O(^\text{ROOT}("AD",\text{SYS},(\text{CODE}_\text{_} \text{"})\text{_})))

The "AD" cross-reference is a coding system specific cross-reference.

**VARIABLES:** Input REV

This is a Reverse $ORDER flag, if set to 1, the $ORDER operation will be in the reverse direction of "D" or "AD" cross-reference (Optional, default is 0, $ORDER forward)

If equal to 1

\$O(^\text{ROOT}("D",\text{WORD})),\text{-}1)
\$O(^\text{ROOT}("AD",\text{SYS},\text{WORD})),\text{-}1)

**VARIABLES:** Output $$OD

This is a 2 piece "^" delimited string containing the Next or Previous Word in the "D" or "AD" cross-reference and accompanying IEN depending on the $ORDER direction established by the input parameter REV.

\text{WORD}^\text{IEN} taken from cross-references

\text{^\text{ROOT}(\text{"D"},\text{WORD},\text{IEN}) or\\^\text{ROOT}(\text{"AD"},\text{SYS},\text{WORD},\text{IEN})}

**COMPONENT:** $$DLM(\text{FILE},\text{IEN},\text{FIELD},\text{CDT})

This entry point returns the date a record or field was last modified. If the field number is passed, then the date last modified (based on date) for the field is returned. If the field is not passed, then the date last modified (based on date) for the record at IEN is returned. The following are valid versioned fields:
File 80

10  Sex            5;0
11  Age Low        6;0
12  Age High       7;0
66  Status         66;0
67  Diagnosis      67;0
68  Description    68;0
71  DRG Grouper    3;0
72  Major Diagnostic Category  4;0
103 Complication/Comorbidity 69;0

File 80.1

10  Sex            3;0
66  Status         66;0
67  Operation/Procedure 67;0
68  Description    68;0
71  DRG Grouper    2;0

VARIABLES: Input  FILE
This is the ICD file number used to determine the
global root to $ORDER through (Required):

80  = ICD Diagnosis file
80.1 = ICD Operation/Procedure file

VARIABLES: Input  IEN
This is an Internal Entry Number (IEN) in the file
specified (Required)

VARIABLES: Input  FIELD
This is the field number of a versioned data
element in the file specified. (Optional, with no
default value)

If the field number is provided then this API will
return the date that the field was last modified.

If the field number is not provided then this API
will return the date that the record was last
modified.

VARIABLES: Input  CDT
This is the Code Set Versioning date (Fileman
format) used to determine the date last modified
(Optional, if not provided then TODAY is used)

VARIABLES: Output  $$DLM
This is the date last modified for the record
identified by the input parameters FILE and IEN.
If the input parameter FIELD is set to a valid
versioned field then this will be the date that
the field was last modified.
or -1 ^ message on error

COMPONENT: $$CS(FILE,FMT,CDT)
This is an interactive entry point to select a coding system.

VARIABLES: Input FILE
This is the ICD file number used to select a coding system (Optional, if not provided you will be prompted for an ICD file Number):

80 = ICD Diagnosis file
80.1 = ICD Operation/Procedure file

VARIABLES: Input FMT
This is a flag to determine the display format for the prompts:

E  Display External only (default)
I  Display External with Internal

Prompt using External only, default:

FMT=E  1  ICD-9-CM
      2  ICD-10-CM

Prompt using External with Internal:

FMT=I  1  ICD-9-CM  (#1)
      2  ICD-10-CM  (#30)

VARIABLES: Input CDT
This is an optional date to use in selecting a coding system. If passed, only coding systems with an implementation date on or before the date passed are selectable (optional)

VARIABLES: Output $$CS
This is a 2 piece "^" delimited string

1  Coding System (internal) 2  Coding System (external)

or -1 on error or non-selection or ^^ double up-arrows or ^ timeout or single up-arrow

COMPONENT: $$EFF(FILE,IEN,CDT)
This entry point returns a codes status, inactivation date and activation date (replaces EFF^ICDSUPT)

VARIABLES: Input FILE
This is an ICD file number (Required):

80 = ICD Diagnosis file
80.1 = ICD Operation/Procedure file

VARIABLES: Input IEN
This is an Internal Entry Number (IEN) in the file
specified (Required)

VARIABLES: Input  CDT
This is the Code Set Versioning date (Fileman format) used to determine the status and effective dates on the date specified (Optional, if not provided then TODAY is used)

VARIABLES: Output  $$EFF
This is a 3 piece "^" delimited string

1  Status
   1 - Active
   0 - Inactive
2  Inactivation Date
3  Activation Date

or
-1^error message

COMPONENT: $$LA(FILE,IEN,CDT)
This entry point returns the last activation effective date based on a date passed.

VARIABLES: Input  FILE
This is an ICD file number (Required):
   80 = ICD Diagnosis file
   80.1 = ICD Operation/Procedure file

VARIABLES: Input  IEN
This is an Internal Entry Number (IEN) in the file specified (Required)

VARIABLES: Input  CDT
This is the Code Set Versioning date (Fileman format) used to determine the last activation date based on the date specified (Optional, if not provided then TODAY is used)

VARIABLES: Output  $$LA
This is the last activation date (Fileman format) or
-1^Not activated on or before date specified

COMPONENT: $$LI(FILE,IEN,CDT)
This entry point returns the last inactivation effective date based on a date passed.

VARIABLES: Input  FILE
This is an ICD file number (Required):
   80 = ICD Diagnosis file
   80.1 = ICD Operation/Procedure file

VARIABLES: Input  IEN
This is an Internal Entry Number (IEN) in the file specified (Required)

VARIABLES: Input CDT
This is the Code Set Versioning date (Fileman format) used to determine the last inactivation date based on the date specified (Optional, if not provided then TODAY is used)

VARIABLES: Output $$LI
This is the last inactivation date (Fileman format) or

\[-1^*\text{Not inactivated on or before date specified}\]

COMPONENT: $$LS(FILE,IEN,CDT)
This entry point returns the last code status based on a date passed.

VARIABLES: Input FILE
This is an ICD file number (Required):

\[
\begin{align*}
80 & = \text{ICD Diagnosis file} \\
80.1 & = \text{ICD Operation/Procedure file}
\end{align*}
\]

VARIABLES: Input IEN
This is an Internal Entry Number (IEN) in the file specified (Required)

VARIABLES: Input CDT
This is the Code Set Versioning date (Fileman format) used to determine the last code status based on the date specified (Optional, if not provided then TODAY is used)

VARIABLES: Output $$LS
This is the last code status based on the date passed.

\[
\begin{align*}
1 & = \text{Active} \\
0 & = \text{Inactive}
\end{align*}
\]

or

\[-1^*\text{No status on or before date specified}\]

COMPONENT: $$NUM(CODE)
This entry point converts a code to a numeric representation (found on the AN cross-reference)

VARIABLES: Input CODE
This is either an ICD diagnosis or procedure code (Required) (This is the opposite of $$COD)

VARIABLES: Output $$NUM
This is a numeric representation of a code.
COMPONENT:  $$COD(NUM)
This entry point converts a numeric representation of a code to a code (found on the AN cross-reference)

VARIABLES: Input      NUM
This is a numeric representation of an ICD diagnosis or procedure code (This is the opposite of $$NUM)

VARIABLES: Output     $$COD
This is an ICD diagnosis or procedure code.

COMPONENT:  $$IE(CODE)
This entry point determines if a code is in an external or internal format without plusing (+) the code.

If you have an ICD-10 code with the letter "E in the center and plus it you will receive a MAXNUMBER error.

Example: If you plus (+) the ICD-10 procedure code "041E499" it will be interpreted as a scientific notation (E499 is a really big number). Applications that plus the ICD code can use this entry point to safely determine a code's format.

VARIABLES: Input      CODE
This is either an ICD diagnosis or procedure code (Required)

VARIABLES: Output     $$IE
This is a set of codes as follows:

I  CODE is in an internal format (IEN)
E  CODE is in an external format (Code)
or
Null on error

COMPONENT:  $$FILE(SYS)
This entry point will return an ICD file number.

VARIABLES: Input      SYS
This is a coding system, a global root or a file identifier.

Global roots ^ICD9( and ^ICD0( are acceptable Coding Systems can be found in file 80.4 File Identifier:  DX or PR DIAG or PROC or OPER

VARIABLES: Output     $$FILE
This is an ICD file number 80 or 80.1 or -1 on error

COMPONENT:  $$ROOT(SYS)
This entry point will return an ICD global root.
VARIABLES: Input  SYS
This is a coding system, file number, a file identifier or even an ICD code, provided the code is unique to a file.

Coding Systems can be found in file 80.4 File Number 80 or 80.1 File Identifier: DX or PR
DIAG or PROC or OPER

VARIABLES: Output  $$ROOT
This is a global root ^ICD9( or ^ICD0( or Null on error

COMPONENT:  $$SYS(SYS,CDT,FMT)
This entry point will return a coding system.

VARIABLES: Input  SYS
This can be either a Coding System name, Abbreviation, system identifier (uses date) or a code.

Coding System Names: ICD-9-CM, ICD-9 Proc, ICD-10-CM or ICD-10-PCS
Coding System Abbreviations: ICD, ICP, 10D or 10P

System Identifier (with date CDT)
Date is before the ICD-10 implementation date

    DIAG, ICD9, 80, DX = 1
    PROC, OPER, ICD0, ICP9, 80.1, PR = 2

Date is on or after the ICD-10 implementation date

    DIAG, ICD9, 80, DX = 30
    PROC, OPER, ICD0, ICP9, 80.1, PR = 31

An ICD code

If an ICD code is unique to an ABA cross-reference then the Coding System can be determined from a code

    ^ICD9("ABA",1,(CODE_ " "))  = 1
    ^ICD9("ABA",30,(CODE_ " ")) = 30
    ^ICD9("ABA",2,(CODE_ " "))  = 2
    ^ICD9("ABA",31,(CODE_ " ")) = 31

VARIABLES: Input  CDT
This is the Code Set Versioning date (Fileman format) used to determine the coding system based on a system identifier (Optional, if not provided then TODAY is used)
VARIABLES:  Input     FMT
This is a single character identifying the desired output format (Optional, default is "I"):

I  Internal (default)
E  External
B  Both Internal ^ External

VARIABLES:  Output     $$SYS
This is the Coding System in the format specified by the input parameter FMT:

<table>
<thead>
<tr>
<th>FMT=I</th>
<th>FMT=E</th>
<th>FMT=B</th>
</tr>
</thead>
<tbody>
<tr>
<td>Internal</td>
<td>External</td>
<td>Both</td>
</tr>
<tr>
<td>1</td>
<td>ICD-9-CM 1^ICD-9-CM</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>ICD-9 Proc 2^ICD-9 Proc</td>
<td></td>
</tr>
<tr>
<td>30</td>
<td>ICD-10-CM 30^ICD-10-CM</td>
<td></td>
</tr>
<tr>
<td>31</td>
<td>ICD-10-PCS 31^ICD-10-PCS</td>
<td></td>
</tr>
</tbody>
</table>

or

-1  on error

COMPONENT:  $$SINFO(SYS,CDT)
This entry point returns coding system information taken from file 80.4.

VARIABLES:  Input     SYS
This can be either a Coding System name, Abbreviation, system identifier, file number or a code. (system identifier and code uses date).

Coding System Names:

ICD-9-CM
ICD-9 Proc
ICD-10-CM or
ICD-10-PCS

Coding System Abbreviations:

ICD, ICP, 10D or 10P

System Identifier/File Number (with date CDT)

Date is before the ICD-10 implementation date

DIAG, ICD9, 80, DX = 1
PROC, OPER, ICD0, ICP9, 80.1, PR = 2

Date is on or after the ICD-10 implementation date

DIAG, ICD9, 80, DX = 30
PROC, OPER, ICD0, ICP9, 80.1, PR = 31
VARIABLES: Input  
CDT
This is the Code Set Versioning date (Fileman format) used to determine the coding system based on a system identifier (Optional, if not provided then TODAY is used)

VARIABLES: Output  
$$SINFO
This is a 6 piece "^" delimited string

1  IEN to file 80.4
2  Coding System
3  Coding System Nomenclature
4  Coding system Abbreviation
5  File where the Coding System is stored
6  Implementation Date

or

-1  on error

COMPONENT: $$SNAM(SYS)
This entry point returns the coding system name.

VARIABLES: Input  
SYS
This is a pointer to the coding system file 80.4

VARIABLES: Output  
$$SNAM
This the coding system name, file 80.4 (.01)

  ICD-9-CM
  ICD-9 Proc
  ICD-10-CM
  ICD-10-PCS

Or -1  on error

COMPONENT: $$SAB(SYS,CDT)
This entry point returns the coding system abbreviation.

VARIABLES: Input  
SYS
This can be either a Coding System name, Abbreviation, system identifier (uses date) or a code.

Coding System Names: ICD-9-CM, ICD-9 Proc, ICD-10-CM or ICD-10-PCS

Coding System Abbreviations: ICD, ICP, 10D or 10P

System Identifier (with date CDT)

Date is before the ICD-10 implementation date

  DIAG, ICD9, 80, DX = 1
  PROC, OPER, ICD0, ICP9, 80.1, PR = 2

Date is on or after the ICD-10 implementation
date

DIAG, ICD9, 80, DX = 30
PROC, OPER, ICD0, ICP9, 80.1, PR = 31

VARIABLES: Input  CDT
This is the Code Set Versioning date (Fileman format) used to determine the source abbreviation based on a system identifier (Optional, if not provided then TODAY is used)

VARIABLES: Output  $$SAB
3 Character Coding System abbreviation, file 80.4 (.02)

  ICD
  ICP
  10D
  10P

Or -1 on error

COMPONENT: $$EXC(FILE,IEN)
This entry point returns a boolean value indicating if an entry in the specified file is to be excluded from lookup. If it is to be excluded, then the entry will not be placed on the selection list for a user to select from. Used primarily for the special lookup.

VARIABLES: Input  FILE
This is an ICD file number:

  80   = ICD Diagnosis file
  80.1 = ICD Operation/Procedure file

VARIABLES: Input  IEN
This is an Internal Entry Number (IEN) in the file specified.

VARIABLES: Output  $$EXC
Boolean value

  1 = Yes, exclude from lookup
  0 = No, include in the lookup

COMPONENT: $$ISA(IEN1,IEN2,FIELD)
This entry point returns a boolean value indicating that one code is a "condition" of another. Conditions include:

  Code 1 is Not Used With Code 2
  Code 1 is Required With Code 2
  Code 1 is Not Considered CC With Code 2

VARIABLES: Input  IEN1
This is the internal entry number (IEN) of a code in file 80 that has a relationship with the code at IEN2. IEN1 is equivalent to Fileman's DA and
identifies a code stored in a multiple in field 20, 30, 40 or pointed to by field 1.11.

VARIABLES:  Input  IEN2
This is the internal entry number (IEN) of a code in file 80 that may have other codes (IEN1) associated with it. IEN2 is equivalent to Fileman's DA(1) and identifies the code in the .01 field.

VARIABLES:  Input  FIELD
This is a field number in file 80 that contains one or more ICD codes that have a relationship to the main entry. Acceptable field numbers and the type of relationships to check include:

<table>
<thead>
<tr>
<th>Field</th>
<th>Relationship</th>
</tr>
</thead>
<tbody>
<tr>
<td>20</td>
<td>Code 1 Not Used With Code 2</td>
</tr>
<tr>
<td>30</td>
<td>Code 1 Required With Code 2</td>
</tr>
<tr>
<td>40 or 1.11</td>
<td>Code 1 Not Considered CC With Code 2</td>
</tr>
</tbody>
</table>

VARIABLES:  Output  $$ISA
This is a Boolean value
1   Yes/The relationship is True
0   No/The relationship is False

Field   Answers the Question
------- --------------------------------
20   Code 1 (identified by IEN1) is not used with Code 2 (identified by IEN2)
30   Code 1 (identified by IEN1) is required with Code 2 (identified by IEN2)
40 or 1.11   Code 1 (identified by IEN1) is not considered Complication Comorbidity (CC) with Code 2 (identified by IEN2)

COMPONENT:  $$EXIST(IEN,FIELD)
This entry point determines if special condition ICD codes exist.

VARIABLES:  Input  IEN
This is an Internal Entry Number (IEN) in the DIAGNOSIS file 80 (Required)

VARIABLES:  Input  FIELD
This is a field number in file 80 that contains one or more ICD codes that have a relationship to the main entry (Required) Acceptable field numbers to check include:

20   Code Not Used With
30   Code Required With
40   Code Not Considered CC With

VARIABLES: Output  $$EXIST
  Boolean value
  1   Yes/True, codes exist
  0   No/False, codes do not exist

Field   Answers the Question
        ____________________________
20   Are there any codes that should not be used with this code (IEN)
30   Are there any codes required with this code (IEN)
40   Are there any codes that are not considered CC with this code (IEN)

COMPONENT:  $$GETDRG(FILE,IEN,CDT,MDC)
  This entry point returns a string of DRGs for an ICD Diagnosis or Procedure code.

VARIABLES: Input  FILE
  This is the ICD file number used to retrieve the DRGs (Required):
    80   = ICD Diagnosis file
    80.1 = ICD Operation/Procedure file

VARIABLES: Input  IEN
  This is an Internal Entry Number (IEN) in the file specified (Required)

VARIABLES: Input  CDT
  This is the Code Set Versioning date (Fileman format) used to identify the DRGs that were appropriate on that date (Optional, if not passed then TODAY is used)

VARIABLES: Input  MDC
  This is a Major Diagnostic Category (pointer to file 80.3) used as a screen to limit the DRGs to an MDC. This input parameter only applies to the ICD OPERATIONS/PROCEDURE file 80.1 which has multiple MDCs, each with a possibility of multiple DRGs (Conditional)

VARIABLES: Output  $$GETDRG
  3 piece semi-colon ";;" delimited string
    1   DRGs delimited by ^
    2   Fiscal Year
    3   Status flag
        0 inactive
        1 active
Example output:

907^908^909^;3071001;1

On Error:

-1;No DRG level;0

COMPONENT: MD(FILE,IEN,CDT,.ARY,FLAG)
This entry point returns an array of Major Diagnostic Categories (MDCs) and Diagnosis Related Groups (DRGs)

VARIABLES: Input  FILE
This is the ICD file number used to retrieve the Major Diagnostic Categories (Required):

80 = ICD Diagnosis file
80.1 = ICD Operation/Procedure file

VARIABLES: Input  IEN
This is an Internal Entry Number (IEN) in the file specified (Required)

VARIABLES: Input  CDT
This is the Code Set Versioning date (Fileman format) used to identify the MDCs that were appropriate on that date (Optional, if not passed then TODAY is used) NOTE: If no Fiscal Year is found for the input date then the first (earliest) Fiscal Year is used.

VARIABLES: Input  .ARY
This is a local array name passed by reference that will contain a list of MDCs by effective date

VARIABLES: Input  FLAG
This is a flag that determines the output format:

I = Internal (default) Internal values are always returned

E = Include External values with Internal values

VARIABLES: Output  ARY
ICD Procedures file 80.1 (multiple MDC)

ARY(<fiscal year>,<MDC>)=DRG^;FY;STA
ARY(<fiscal year>,<MDC>)="DRG^DRG^;FY;STA

If Flag contains "E"

ARY(<fiscal year>,"E",<MDC>)=MDC Name
ARY(<fiscal year>,"E",<MDC>,<DRG>)=DRG Name
ARY(<fiscal year>,"E",<MDC>)=MDC Name
ARY(<fiscal year>,"E",<MDC>,<DRG>)=DRG Name
ARY(<fiscal year>,"E",<MDC>,<DRG>)=DRG Name
ARY(<fiscal year>,"E","FY")=External FY

ICD Diagnosis file 80 (single MDC)

ARY(<fiscal year>,<MDC>)="DRG^DRG;FY;STA

If Flag contains "E"

ARY(<fiscal year>,"E",<MDC>)=MDC Name
ARY(<fiscal year>,"E",<MDC>,<DRG>)=DRG Name
ARY(<fiscal year>,"E",<MDC>,<DRG>)=DRG Name
ARY(<fiscal year>,"E","FY")=External FY

NOTE: If no Fiscal Year found for the input date then the first (earliest) Fiscal Year is used.

COMPONENT: $$EFM(CDT)
This entry point converts an external date to a Fileman internal date. This entry point replaces unsupported $$DGY2K^DGPTODO(X)

VARIABLES: Input     CDT
            External date (Required), examples of valid dates:
            JAN 20 1957 or 20 JAN 57
            1/20/57 or 012057
            T   (for TODAY)
            T+1 (for TOMORROW), T+2, etc.
            T-1 (for YESTERDAY)
            T-3W (for 3 WEEKS AGO), etc.

VARIABLES: Output    $$EFM
            Internal Fileman Date
            or -1 on error

COMPONENT: $$FY(CDT)
This entry point returns the 4 digit fiscal year for a specified date. This entry point replaces unsupported $$FY^DGPTOD0(X)

VARIABLES: Input     CDT
            This is an internal Fileman date.

VARIABLES: Output    $$FY
            This is a 4 digit fiscal year (YYYY) for the date specified or null on error.

COMPONENT: $$VMDCDX(IEN,CDT)
This entry point returns the versioned Major Diagnostic Code for an ICD Diagnosis.

VARIABLES: Input     IEN
            This is an Internal Entry Number (IEN) in the DIAGNOSIS file 80 (Required)

VARIABLES: Input     CDT
This is the Code Set Versioning date (Fileman format) used to identify the MDCs that was appropriate on that date (Optional, if not passed then TODAY is used)

VARIABLES: Output  $$VMDCDX
This is a single MDC (pointer to file 80.3) active on the date specified.

COMPONENT:  $$VMDCOP(IEN,MDC,CDT)
This entry point returns the versioned Major Diagnostic Codes for an ICD Procedure.

VARIABLES:  Input    IEN
This is an Internal Entry Number (IEN) in the OPERATION/PROCEDURE file 80.1 (Required)

VARIABLES:  Input    MDC
This is a Major Diagnostic Category (pointer to file 80.3) used as a screen to limit the results to a single MDC (Required)

VARIABLES:  Input    CDT
This is the Code Set Versioning date (Fileman format) used to identify the MDC that was appropriate on that date (Optional, if not passed then TODAY is used)

VARIABLES:  Output    $$VMDCOP
4 piece "^" delimited string
   1 Fiscal Year, Fileman format
   2 MDC, pointer to file 80.3
   3 Fiscal Year, pointer to sub-file 80.171 (formerly DADRGFY)
   4 MDC, pointer to sub-file 80.1711 (formerly DAMDC)

COMPONENT:  MDCG(IEN,CDT,.)ARY
This entry point sets up an array of MDCs (later used in $$MDCT)

VARIABLES:  Input    IEN
This is an Internal Entry Number (IEN) in the DIAGNOSIS file 80 (Required)

VARIABLES:  Input    CDT
This is the Code Set Versioning date (Fileman format) used to identify the MDCs that were appropriate on that date (Optional, if not passed then TODAY is used)

VARIABLES:  Input    .ARY
This is a local array name passed by reference that will contain a list of MDCs (Required)

VARIABLES:  Output    ARY
This is an array listing MDCs for all DRGs associated with a diagnosis on the date specified.

\[
\text{ARY}(MDC) = ""
\text{ARY}(MDC) = ""
\]

COMPONENT: \$\text{MDCT}(\text{IEN}, \text{CDT}, \text{.ARY}, \text{FMT})
This entry point compares a single entry in the ICD OPERATIONS/PROCEDURE file 80.1 to an array of Major Diagnostic Categories to see if the ICD procedure is assigned to one or more of the MDCs in the array.

VARIABLES: Input IEN
This is an Internal Entry Number (IEN) in the OPERATIONS/PROCEDURE file 80.1 (Required)

VARIABLES: Input CDT
This is the Code Set Versioning date (Fileman format) used to identify the MDCs that were appropriate on that date (Optional, if not passed then TODAY is used)

VARIABLES: Input .ARY
This is a local array passed by reference containing a list of MDCs for comparison (Required)

VARIABLES: Input FMT
This is a flag defining the output format (optional):

\[
\begin{align*}
0 & \quad \text{Boolean value only (default)} \\
1 & \quad 2 \text{ piece } ^{^\text{^\text{"}}} \text{ delimited string} \\
1 & \quad \text{Boolean value} \\
2 & \quad \text{String of matching MDCs delimited by } ;
\end{align*}
\]

VARIABLES: Output \$\$\text{MDCT}
Boolean value

\[
\begin{align*}
0 & \quad \text{The ICD Procedure code identified by IEN does not include any of the MDCs passed in } .\text{ARY}(MDC) \text{ on the date specified (CDT)} \\
1 & \quad \text{The ICD Procedure code identified by IEN includes one or more of the MDCs passed in } .\text{ARY}(MDC) \text{ on the date specified (CDT)}
\end{align*}
\]

Assuming the following input parameters:

\begin{align*}
\text{IEN}=4 \\
\text{CDT}=3111110 \\
\text{ARY}(2) = "" \\
\text{ARY}(21) = ""
\end{align*}

Output format when input parameter FMT=0
$\text{MDCT}(IEN,CDT,.ARY) = "1"$

Output format when input parameter FMT=1

$\text{MDCT}(IEN,CDT,.ARY) = "1^2;21"$

**COMPONENT:** $\text{MDCD}(IEN,MDC,CDT)$

This entry point checks for a Major Diagnostic Category MDC in the ICD OPERATION/PROCEDURE file.

**VARIABLES:**

**Input**  
IEN  
This is an Internal Entry Number (IEN) in the OPERATIONS/PROCEDURE file 80.1 (Required)

**Input**  
MDC  
This is a Major Diagnostic Category (pointer to file 80.3) (Required)

**Input**  
CDT  
This is the Code Set Versioning date (Fileman format) used to identify the MDCs that were appropriate on that date (Optional, if not passed then the first FY is used)

**Output**  
$\text{MDCD}$  
Boolean value

- 0  MDC does not exist on date specified
- 1  MDC exist on date specified

**COMPONENT:** $\text{MOR}(IEN)$

This entry point returns the Major O.R. Procedure string

**VARIABLES:**

**Input**  
IEN  
This is an Internal Entry Number (IEN) in the OPERATIONS/PROCEDURE file 80.1 (Required)

**Output**  
$\text{MOR}$  
Major O.R. Procedure or Null if the procedure is not defined as a Major O.R. Procedure or is not found

Major O.R. Procedure definitions include:

- 1  Bowel
- 2  Chest
- 3  Lymphoma/Leukemia
- 4  Joint
- 5  Pancreas/Liver
- 6  Pelvic
- 7  Shoulder/Elbow
- 8  Thumb/Joint
- 9  Head/Neck
- A  Cardio M
- B  Spine

**COMPONENT:** $\text{UPDX}(IEN)$

This entry point determines if a diagnosis is unacceptable as a principle diagnosis.

**VARIABLES:**

**Input**  
IEN
This is an Internal Entry Number (IEN) in the DIAGNOSIS file 80 (Required)

VARIABLES: Output $$SUPDX

Boolean value, answers the question:

Is the diagnosis UNACCEPTABLE as a Principle DX?

1  Yes  Code is Unacceptable as Principle DX
0  No   Code is Acceptable as Principle DX

COMPONENT: $$NOT(IEN, SUB, FMT)
This entry point returns the number of ICD codes that cannot be used with a specified code. It can also return a global array containing a list of the codes that cannot be used with the specified code.

VARIABLES: Input IEN

This is an Internal Entry Number (IEN) in the DIAGNOSIS file 80 (Required)

VARIABLES: Input SUB

This is a subscript name used in a ^TMP global array (Optional, if not provided, the subscript "ICDNOT" will be used)

^TMP(SUB,$J)

VARIABLES: Input FMT

This is a flag defining the output format.

0 - Total number only (default)
1 - Total number with global array

VARIABLES: Output $$NOT

The number of ICD codes that cannot be used with the ICD code identified by IEN (FMT=0 or 1)

TMP global array as follows (FMT=1):

^TMP(SUB,$J,IEN)=CODE
^TMP(SUB,$J,"B",(CODE_" "),IEN)="

COMPONENT: $$REQ(IEN, SUB, FMT)
This entry point returns the number of ICD codes that are required when the specified code is used. It can also return a global array containing a list of the codes that are required when the specified code is used.

VARIABLES: Input IEN

This is an Internal Entry Number (IEN) in the DIAGNOSIS file 80 (Required)

VARIABLES: Input SUB

This is a subscript name used in a ^TMP global array (Optional, if not provided, the subscript
"ICDREQ" will be used)

\^TMP(SUB,$J)

**VARIABLES:** Input FMT

This is a flag defining the output format.

0 - Total number only (default)
1 - Total number with global array

**VARIABLES:** Output $$REQ

The number of ICD codes required when the ICD code identified by IEN is used. (FMT=0 or 1)

TMP global array as follows (FMT=1):

\^TMP(SUB,$J,IEN)=CODE
\^TMP(SUB,$J,"B",(CODE_" "),IEN)="

**COMPONENT:** $$NCC(IEN,SUB,FMT)

This entry point returns the number of ICD codes that are not considered CC with a specified code. It can also return a global array containing a list of the codes that are not considered CC with a specified code.

**VARIABLES:** Input IEN

This is an Internal Entry Number (IEN) in the DIAGNOSIS file 80 (Required)

**VARIABLES:** Input SUB

This is a subscript name used in a ^TMP global array (Optional, if not provided, the subscript "ICDNCC" will be used)

\^TMP(SUB,$J)

**VARIABLES:** Input FMT

This is a flag defining the output format.

0 - Total number only (default)
1 - Total number with global array

**VARIABLES:** Output $$NCC

The number of ICD codes not considered CC with the code identified by IEN. (FMT=0 or 1)

TMP global array as follows (FMT=1):

\^TMP(SUB,$J,IEN)=CODE
\^TMP(SUB,$J,"B",(CODE_" "),IEN)="

**COMPONENT:** LK

Special Lookup (called by DIC)

This is the Special Lookup program for files 80 and 80.1. Only the ^DIC call honors the special lookup routines. Those calls that allow the user to specify the indexes (IX^DIC and
MIX^DIC1), and the Data Base Server calls (FIND^DIC, $$FIND1^DIC, and UPDATE^DIE) all ignore the Special Lookup Program. Also, if DIC(0) contains an "I" then the Special Lookup program will be ignored.

This routine uses a majority of the variables used in calling Fileman ^DIC. In addition to the Fileman variables, there are three special variables that aid in controlling the lookup that can be set and killed by the calling application:

Versioning Date (Fileman format)

ICDVDT or
^TMP("ICDEXLK",$J,"ICDVDT")=<versioning date>

Coding System (from file 80.4)

ICDSYS or
^TMP("ICDEXLK",$J,"ICDSYS")=<coding system>

Display Format (numeric, 1-4) (new)

ICDFMT or
^TMP("ICDEXLK",$J,"ICDFMT")=<display format>

VARIABLES: Input ICDVDT
Versioning Date (Fileman format)

ICDVDT or
^TMP("ICDEXLK",$J,"ICDVDT")=<date>

This is a Code Set Versioning Date (in Fileman format). If set, it must also be killed by the calling application.

If supplied, it is assumed that the lookup is to be a versioned lookup and only active codes on that date will be included in the selection list.

If not supplied, the date will default to TODAY and all codes may be selected, active and inactive.

In both cases the display will be altered based on the date.

VARIABLES: Input ICDSYS
Coding System (from file 80.4)

ICDSYS or
^TMP("ICDEXLK",$J,"ICDSYS")=<coding system>

This is the Coding System taken from file 80.4. If set, it must be killed by the calling application. It may be any of the following:

1 ICD ICD-9-CM
If supplied, the lookup will only look in the cross-references specific for that coding system.

VARIABLES: Input ICDFMT
Display Format (numeric, 1-4)

ICDFMT or
^TMP("ICDEXLK",$J,"ICDFMT")=<display format>

This is a flag defining a Display Format (numeric, 1-4). If set, it must be killed by the calling application.

1 = Fileman format, code and short text (default)

\[250.00\] DMII WO CMP NT ST UNCNTR

2 = Fileman format, code and description

\[250.00\] DIABETES MELLITUS WITHOUT MENTION OF COMPLICATION, TYPE II OR UNSPECIFIED TYPE, NOT STATED AS UNCONTROLLED

3 = Lexicon format, short text followed by code

DMII WO CMP NT ST UNCNTR (250.00)

4 = Lexicon format, description followed by code

DIABETES MELLITUS WITHOUT MENTION OF COMPLICATION, TYPE II OR UNSPECIFIED NOT STATED AS UNCONTROLLED (250.00)

VARIABLES: Input X
This is the user's input, if not available the user will be prompted for input.

VARIABLES: Input FILEMAN
FileMan Variables used

DIC, DIC(0), DIC("A"), DIC("B"), DIC("S"), DIC("W"), DIC("?N"),<file>)

FileMan Variables not used:

DIC("DR"), DIC("PTRIX","fm","to","<file>),
DIC("T"), DIC("V"), DIC("?PARAM")
DIC(0) parameters applicable to a versioned file

A  Ask the entry; if erroneous, ask again
B  Only the B index is used
E  Echo information
F  Forget the lookup value
I  Ignore the special lookup program
M  Multiple-index lookup allowed
N  Uppercase, IEN lookup allowed (not forced)
O  Only find one entry if it matches exactly
S  Suppresses display of .01
T  Search until user selects or enters ^^
X  EXact match required
Z  Zero node in Y(0), external form in Y(0,0)

DIC(0) parameters NOT applicable to a versioned file and not used

C  Versioned cross-references not turned off
K  Primary Key not established
L  Learning a new entry LAYGO not allowed
n  ICD has no pure numeric entries
Q  Input is pre-processed, ?? not necessary
U  All values are external
V  Verification is not optional

FileMan Variables KILLED:

DLAYGO
DINUM

VARIABLES: Output  Y

Fileman Compliant:

Y      IEN ^ Code

If DIC(0) containing "Z"

Y(0)    0 Node
Y(0,0)   Code

Non-Fileman Compliant, DIC(0) contains "Z"

Y(0,1)  $$ICDDX or $$ICDOP
Y(0,2)   Long Description

COMPONENT: $$LKTX(X,ROOT,CDT,SYS,VER,OUT)
This entry point is a lookup for text in either file 80 or 80.1 It is similar to the special lookup except there is no
prompt for input or display for selection (silent) and
intended for GUI applications.

VARIABLES: Input  X
This is a string of text to search for.

VARIABLES: Input  ROOT
This is either a global root or file number to
indicate either the DIAGNOSIS file 80 or the OPERATIONS/PROCEDURE file 80.1

VARIABLES: Input  

CDT
This is the Code Set Versioning date (Fileman format) used to determine the status of a code (active or inactive). It normally represents the date that service was provided to the patient (HIPAA). However, it may also represent the date of onset, visit date or movement date depending on the application calling the lookup.

VARIABLES: Input  

SYS
This is a coding system identifier (pointer to file 80.4)

1 = ICD-9-CM  
2 = ICD-9-PCS  
30 = ICD-10-CM  
31 = ICD-10-PCS

VARIABLES: Input  

VER
This is the versioned flag (boolean) to indicate if the lookup is to be versioned or not:

0 No Include all codes, active and inactive  
1 Yes Include only Active codes for date specified

VARIABLES: Input  

OUT
This is a flag that defines the output format:

1 Fileman, Code and Short Text (default)  
250.00 DMII WO CMP NT ST UNCNTR  
2 Fileman, Code and Description  
250.00 DIABETES MELLITUS WITHOUT MENTION OF COMPLICATION TYPE II OR UNSPECIFIED TYPE, NOT STATED AS UNCONTROLLED  
3 Lexicon, Short Text and Code  
DMII WO CMP NT ST UNCNTR (250.00)  
4 Lexicon, Description and Code  
DIABETES MELLITUS WITHOUT MENTION OF COMPLICATION, TYPE II OR UNSPECIFIED, NOT STATED AS UNCONTROLLED (250.00)

VARIABLES: Output  

$$LK
This is the number of entries found
The entries will be included in a ^TMP Global Array:

^TMP(ID,$J,"SEL")
^TMP(ID,$J,"SEL",0)=# of entries
^TMP(ID,$J,"SEL",#)=IEN ^ Display Text

Where ID is a package namespaced subscript:

ICD9 - for file #80
ICD0 - for file #80.1

COMPONENT: $$VER(SYS,REL)
This API returns the current Coding System version, the previous Coding System version or the next Coding System version based on input parameters.

VARIABLES: Input SY$ SYS
This is a pointer to the coding system file 80.4

VARIABLES: Input REL
This input parameter indicates the relationship of the output coding system to the input coding system (Optional)

0 N/A - Return the current version (default)
1 Return the next version
-1 Return the previous version

VARIABLES: Output $$VER
This is a 5 piece string containing:

1 Coding System (pointer to file 80.4)
2 Coding System Nomenclature
3 Coding System Abbreviation
4 File Number containing the Coding System
5 Date Coding System was Implemented or
-1 on error

COMPONENT: Y(ROOT,IEN,CDT,FMT)
Given the global root or file number, the Internal Entry Number (IEN) and a date, this API will return the equivalent of FileMan's output variable Y without having to perform the lookup.

VARIABLES: Input ROOT
This is either an ICD global root or file number.

VARIABLES: Input IEN
This is an Internal Entry Number in the file identified by the input parameter ROOT.

VARIABLES: Input CDT
This is a code set versioning date used to returned versioned (date sensitive) data from the ICD files.
VARIABLES: Input FMT
This is an output format flag (optional, default 0).

0  Return standard Fileman Y - IEN ^ CODE
1  Return Expanded Y as if DIC(0) contained a "Z"

VARIABLES: Output Y
Input parameter FMT = 0 or 1

Y = IEN ^ Code

Input parameter FMT = 1

FileMan Compliant

Y(0) = 0 Node (aka Code)
Y(0,0) = .01 Field (aka Code)

Non-FileMan Compliant

Y(0,1) = $$ICDDX or $$ICDOP
Y(0,2) = Versioned Long Description

COMPONENT: TOKEN(TEXT,ROOT,SYS,.ARY)
This API parses text into words/tokens and saves them in a local array for later processing. Words and tokens not found in the file and coding system identified by the input parameters are not included in the output array.

VARIABLES: Input TEXT
This is a text string to parse.

VARIABLES: Input ROOT
This is a global root or file number (required)

^ICD9{ or 80
^ICD0{ or 80.1

VARIABLES: Input SYS
This is the coding system (Required)

1 or ICD or ICD-9-CM
2 or ICP or ICD-9 Proc
30 or 10D or ICD-10-CM
31 or 10F or ICD-10-PCS

VARIABLES: Both .ARY
This is the output array passed by reference containing words parsed from the input string TEXT and arranged by frequency of use (Required)

ARY(USE,SYS)=WORD

Where USE is the number of times the word was used
in the file identified by ROOT and coding system SYS and WORD is a single word found in designated coding system

COMPONENT:  $$WORD\,(\text{WORD}, \text{ROOT}, \text{SYS})

This API determines if a word is found in a file or a coding system identified by the input parameters.

VARIABLES:  Input \quad \text{WORD}

This is a single word.

VARIABLES:  Input \quad \text{ROOT}

This is a global root or file number (optional)

\begin{align*}
^\text{ICD9}( & \quad \text{or} \quad 80 \\
^\text{ICD0}( & \quad \text{or} \quad 80.1
\end{align*}

VARIABLES:  Input \quad \text{SYS}

This is the coding system (Optional)

\begin{align*}
1 & \quad \text{or} \quad \text{ICD} \quad \text{or} \quad \text{ICD-9-CM} \\
2 & \quad \text{or} \quad \text{ICF} \quad \text{or} \quad \text{ICD-9-Proc} \\
30 & \quad \text{or} \quad \text{10D} \quad \text{or} \quad \text{ICD-10-CM} \\
31 & \quad \text{or} \quad \text{10P} \quad \text{or} \quad \text{ICD-10-PCS}
\end{align*}

VARIABLES:  Output \quad $$WORD

This is a Boolean value indicating if a word is contained in a set (file or system).

\begin{align*}
1 & = \text{Word was found} \\
0 & = \text{Word was not found}
\end{align*}

If ROOT is not supplied, the word was found in either file 80 or 80.1

If SYS is not supplied, the word was found in the file designated by ROOT in any coding system in the file

If both ROOT and SYS are supplied, the word was found in the specified coding system

COMPONENT:  $$ICDIDS\,(\text{FILE}, \text{CODE}, \text{ARY})

This API returns an array of Diagnosis or Procedure code identifiers used in the calculation of DRG groups.

VARIABLES:  Input \quad \text{FILE}

This is the ICD file number used to retrieve the identifier codes (Required):

\begin{align*}
80 & = \text{ICD Diagnosis file} \\
80.1 & = \text{ICD Operation/Procedure file}
\end{align*}

VARIABLES:  Input \quad \text{CODE}

This is an Internal Entry Number (IEN) in the file
specified (Required).

VARIABLES: Both ARY
This is a local array of identifiers found for the code identified input parameters FILE and CODE.

ARY(<identifier>)=""

VARIABLES: Output $$ICDIDS
This is the number of identifiers found for the code identified by the input parameters FILE and CODE, or upon error:

-1^error message

COMPONENT: $$ICDID(FILE,ID,CODE)
This API checks if a specified ICD identifier exist for a code identified by the input parameters FILE and CODE.

VARIABLES: Input FILE
This is the ICD file number used to retrieve the identifier codes (Required):

80 = ICD Diagnosis file
80.1 = ICD Operation/Procedure file

VARIABLES: Input ID
This is a Diagnosis or Procedure code identifier (required)

VARIABLES: Input CODE
This is an Internal Entry Number (IEN) in the file specified (Required).

VARIABLES: Output $$ICDID
Boolean value

1 if identifier was found for code
0 if identifier was not found for code
or upon error -1^error message

COMPONENT: $$ISOWNCC(IEN,CDT,FMT)
This API returns the Complication/Comorbidity (CC) value for an ICD Diagnosis code when the primary diagnosis is its own CC/MCC.

VARIABLES: Input IEN
This is the Internal Entry Number (IEN) of the ICD Diagnosis file #80.

VARIABLES: Input CDT
Date to use to extract CC (default TODAY)

VARIABLES: Input FMT
This is a flag that controls the output format:
0 = CC only (default)
1 = CC ^ Effective Date

VARIABLES: Output $$$ISOWNCC
Complication/Comorbidity (CC)

<table>
<thead>
<tr>
<th>DX is Own CC</th>
<th>Format</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>0</td>
<td>CC Value</td>
</tr>
<tr>
<td>Yes</td>
<td>1</td>
<td>CC Value ^ Effective Date</td>
</tr>
<tr>
<td>No</td>
<td>N/A</td>
<td>0 (zero)</td>
</tr>
</tbody>
</table>

or upon error -1^error message

COMPONENT: $$$ICDRGCC(DRG,CDT)
This API returns the CC/MCC flag from DRG file #80.2

VARIABLES: Input DRG
This is an Internal Entry Number for the DRG file 80.2 (required)

VARIABLES: Input CDT
Date to use to extract CC/MCC flag (default TODAY)

VARIABLES: Output $$$ICDRGCC
This is the Complication/Comorbidity/Major CC flag

0   No CC or MCC
1   CC present
2   MCC present
3   CC or MCC present

or upon error -1^error message

COMPONENT: $$DRG(CODE,CDT)
This API returns basic information about a DRG.

VARIABLES: Input CODE
DRG code, internal or external format (Required)

VARIABLES: Input CDT
Date to check status for, FileMan format (default = TODAY)

If CDT < 10/1/1978, use 10/1/1978
If CDT > DT, validate with In/Activation Dates
If CDT is year only, use first of the year
If CDT is year and month, use first of the month

VARIABLES: Output $$DRG
Returns an 22 piece string delimited by the up-arrow (^) the pieces are:

1  DRG name (field #.01)
2  Weight (field #2)
3  Low Trim (days) (field #3)
<table>
<thead>
<tr>

or

-1^Error Description

**COMPONENT:** $\$DRGD(CODE,ARY,CDT)

Returns an unformatted DRG Description.

**VARIABLES: Input **

- **CODE**
  
  ICD Code, Internal or External Format (required)

**VARIABLES: Both **

- **ARY**
  
  Input: Name of Output Array for description

  e.g. "ABC" or "ABC("TEST")"

  Default = ^TMP("DRGD",$J)

Output: Description in array

  @ARY(1:n) - Description (lines 1-n)
  @ARY(n+1) - Blank
  @ARY(n+1) - Warning Message

  or

-1^Error Description

**NOTE:**

User must initialize ^TMP("DRGD",$J) if used. The data is place in the array unformatted, exactly as it is in the DESCRIPTION multiple (sub-files #80.068 or #80.168)

**SEE ALSO:**
$$\text{DRGDES}^\text{ICDEX}(\text{IEN, CDT, ARY, LENGTH}) \text{ to retrieve the description formatted into string lengths specified by input parameter for length.}

\textbf{VARIABLES: Input} \quad \text{CDT}
\begin{align*}
\text{Date to screen against (default = TODAY)}
\end{align*}
\begin{align*}
\text{If CDT} & < 10/1/1978, \text{ use } 10/1/1978 \\
\text{If CDT} & > \text{DT, use DT} \\
\text{If CDT} & = \text{year only, use } 01/01/yyyy \\
\text{If CDT} & = \text{year & month, use mm/01/yyyy}
\end{align*}

\textbf{VARIABLES: Output} \quad \$$\text{DRGD}
\begin{align*}
\text{This is the number of lines in description output array.}
\end{align*}

\textbf{COMPONENT:} \quad $$\text{DRGDES}(\text{IEN, CDT, ARY, LEN})$
\begin{align*}
\text{This API returns the DRG Description formatted into string lengths specified by the calling application.}
\end{align*}

\textbf{VARIABLES: Input} \quad \text{IEN}
\begin{align*}
\text{Internal Entry Number of DRG file 80.2}
\end{align*}

\textbf{VARIABLES: Input} \quad \text{CDT}
\begin{align*}
\text{Date to screen against (default = TODAY)}
\end{align*}

\textbf{VARIABLES: Both} \quad \text{ARY}
\begin{align*}
\text{This is a local array passed by reference containing the DRG description. The text is formatted into string lengths specified by the LEN input parameter.}
\end{align*}

\textbf{VARIABLES: Input} \quad \text{LEN}
\begin{align*}
\text{Length of line of the description in the output array}
\end{align*}
\begin{align*}
\text{Missing} & \quad \text{Defaults to 79} \\
\text{Less than 25} & \quad \text{Defaults to 25}
\end{align*}

\textbf{VARIABLES: Output} \quad $$\text{DRGDES}$
\begin{align*}
\text{This is the number of lines in description output array.}
\end{align*}

\textbf{COMPONENT:} \quad $$\text{DRGN}(\text{CODE})$
\begin{align*}
\text{This API returns the Internal Entry Number (IEN) of the DRG specified by a DRG code.}
\end{align*}

\textbf{VARIABLES: Input} \quad \text{CODE}
\begin{align*}
\text{This is a DRG code.}
\end{align*}

\textbf{VARIABLES: Output} \quad $$\text{DRGN}$
\begin{align*}
\text{This is the IEN of the DRG code specified.}
\end{align*}

\textbf{COMPONENT:} \quad $$\text{EFD}(\text{X})$
\begin{align*}
\text{This is an interactive API that will prompt the user for an effective date in a range of dates.}
\end{align*}
VARIABLES:  Output  $$EFD
This is a 3 piece "^" delimited string containing an effective date in both internal and external formats:

1  Date Fileman format     nnnnnnn
2  Date External Short Format  mm/dd/yyyy
3  Date External Long Format  Mmm dd, yyyy

or
"^^" if the user enters double up-arrows
"^^" if the user enters a single up-arrow
""   if the user times out

The earliest possible date is Oct 1, 1978, the initial ICD implementation date in the VA.

If today's date is less than the implementation date of ICD-10, then the latest possible date is 3 years from the ICD-10 implementation date.

If today's date is greater than the implementation date of ICD-10, then the latest possible date is 3 years from today's date.

COMPONENT:  $$GETDATE(IEN)
This API calculates the Effective Date to use retrieving ICD/DRG data based on a patient's treatment.

VARIABLES:  Input     IEN
This is an Internal Entry Number of the PTF file #45

VARIABLES:  Output    $$GETDATE
This is the correct "EFFECTIVE DATE" for a patient to be used retrieving DRG/ICD/CPT data (default TODAY)

"EFFECTIVE DATE" Derived from:

Census Date         ^DGPT     0;13
Discharge Date      ^DG(45.86  0;1
Surgery Date        ^DGPT(D0,"S"  0;1
Movement Date       ^DGPT(D0,"M"  0;10
Default              $$NOW^XLFDT

COMPONENT:  $$IA(FILE,IEN)
This API returns an codes Initial Activation Date based on a file number and the codes Internal Entry Number. The Initial Activation date may be different from the Last Activation date (see $$LA) if the code was re-used.

VARIABLES:  Input     FILE
This is a Global Root or File Number for either the ICD Diagnosis or ICD Procedure files (Required)
VARIABLES: Input  IEN
    This is an Internal Entry Number (IEN) in the
    specified file (Required)

VARIABLES: Output  $$IA
    Initial Activation Date
    OR
    -1 ^ Error Message

COMPONENT: $$IDSTR(FILE,IEN)
    This API returns a string of ICD identifier associated with
    either an ICD Diagnosis or ICD Procedure code (supports legacy
    APIs)

VARIABLES: Input  FILE
    File Number or root (required)
       80 or ^ICD9    = File #80
       80.1 or ^ICD0  = File #80.1

VARIABLES: Input  IEN
    This is a Diagnosis/Procedure code IEN (required)

VARIABLES: Output  $$IDSTR
    This is a string of Identifiers delimited by a
    semi-colon
    ID;ID;ID

COMPONENT: $$ISVALID(FILE,IEN,CDT)
    This API determine is an ICD code is valid.

VARIABLES: Input  FILE
    This is a file number or global root for either
    the ICD Diagnosis file or the ICD Procedure file

VARIABLES: Input  IEN
    This is an Internal Entry Number (IEN) in the file
    specified.

VARIABLES: Input  CDT
    This is the date to use to determine if the code
    is valid for date (default TODAY)

VARIABLES: Output  $$ISVALID
    This is a Boolean value
       1 if the code is valid
       0 if the code is not valid

COMPONENT: $$PDXE(IEN)
    This API returns the Primary Diagnosis Exclusion Code.

VARIABLES: Input  IEN
This is an Internal Entry Number (IEN) for the ICD Diagnosis file #80

VARIABLES: Output $PDXE
This is a pointer to DRG CC Exclusions file #82.13

COMPONENT: $REF(IEN,CDT)
This API returns the name of the DRG Reference Table.

VARIABLES: Input IEN
This is an Internal Entry Number (IEN) of the DRG file #80.2

VARIABLES: Input CDT
Effective date to use (default TODAY)

VARIABLES: Output $REF
Table reference associated with a DRG entry or null if not found

COMPONENT: $VCCP(IEN,CDT,FMT)
This API returns the CC Primary Flag for a diagnosis.

VARIABLES: Input IEN
This is an Internal Entry Number (IEN) in the ICD Diagnosis file 80 (required)

VARIABLES: Input CDT
This is the date to use to Extract CC Primary Flag (default TODAY)

VARIABLES: Input FMT
Is a flag to determine the output format (optional):

0 = CC Primary Flag only (default)
1 = CC Prim Flag^Effective Date^Value

VARIABLES: Output $VCCP
This the CC Primary Flag in one of two formats:

CC Primary Flag only (FMT=0)
CC Primary Flag^Effective Date^Value (FMT=1)

COMPONENT: $DRGW(IEN)
This API returns the DRG Weighted Work Unit (WWU)

VARIABLES: Input IEN
This is an Internal Entry Number (IEN) of the DRG file 80.2

VARIABLES: Output $DRGW
This is the Weighted Work Unit (WWU) for a DRG

COMPONENT: $DRGC(IEN)
This API returns the DRG code.
VARIABLES: Input  IEN  
This is an Internal Entry Number (IEN) of the DRG file 80.2

VARIABLES: Output  $$DRGC  
This is a DRG Code (field .01)

COMPONENT:  $$MDCN(IEN)  
This API returns the name of a Major Diagnostic Category (MDC)

VARIABLES: Input  IEN  
This is the Internal Entry Number (IEN) for file 80.3

VARIABLES: Output  $$MDCN  
This is a Major Diagnostic Category Name

COMPONENT:  $$HDR(FILE)  
This API returns the header node of either file 80 or 80.1.

VARIABLES: Input  FILE  
This is a File Number or Global Root

     80    or  ^ICD9(  
     80.1  or  ^ICD0(  

VARIABLES: Output  $$HDR  
This is the header node of either the ICD Diagnosis file 80 or the Operation Procedure file 80.1

     ^ICD9()  
     ^ICD0()  

COMPONENT:  $$IEN(CODE,ROOT,SYS)  
This API returns an internal entry number for a code based on file/global root and coding system.

This API is similar to $$CODEABA^ICDEX except it will also return IENs for codes excluded from lookup and VA Local Codes. Its primary purpose to support file maintenance. Use with great caution.

DO NOT USE in any application that requires codes and text to be versioned (date sensitive).

VARIABLES: Input  CODE  
This is an ICD Diagnosis or Procedure Code from either the ICD-9 or ICD-10 coding systems (required)

VARIABLES: Input  ROOT  
This is a file number or global root (optional)

     ^ICD9(  or  80  
     ^ICD0(  or  80.1
VARIABLES: Input  SYS
   This is a coding system (optional)
       1 = ICD-9 Diagnosis
       2 = ICD-9 Procedure
       30 = ICD-10 Diagnosis
       31 = ICD-10 Procedure

VARIABLES: Output  $$IEN
   Returns the Internal Entry Number (IEN) for a CODE
   or -1 if not found

COMPONENT: $$SDH(FILE,IEN,ARY)
   This API returns a history of Short Description changes by
date.

VARIABLES: Input  FILE
   This is an ICD file number:
       80 = ICD Diagnosis file
       80.1 = ICD Operation/Procedure file

VARIABLES: Input  IEN
   This is an Internal Entry Number (IEN) in the file
   specified.

VARIABLES: Input  .ARY
   This is a local array name passed by reference
   that will contain the code's short description
   history.

VARIABLES: Output  $$SDH
   This is a three piece "^" delimited string
   containing:
       1   The number of short descriptions found
       2   The earliest date found
       3   The latest date found

VARIABLES: Output  ARY
   This is a local array containing a history of
   Short Descriptions by date:
       ARY(0)= # ^ Earliest Date ^ Latest Date
       ARY(DATE)=Long Description

COMPONENT: $$LDH(FILE,IEN,ARY)
   This API returns a history of Long Description changes by
date.

VARIABLES: Input  FILE
   This is an ICD file number:
       80 = ICD Diagnosis file
       80.1 = ICD Operation/Procedure file

VARIABLES: Input  IEN
This is an Internal Entry Number (IEN) in the file specified.

VARIABLES: Input .ARY
This is a local array name passed by reference that will contain the code's long description history.

VARIABLES: Output $$LDH
This is a three piece "^" delimited string containing:

1. The number of long descriptions found
2. The earliest date found
3. The latest date found

OR -1 ^ Error Message

VARIABLES: Output ARY
This is a local array containing a history of Long Descriptions by date:

ARY(0)= # ^ Earliest Date ^ Latest Date
ARY(DATE)=Long Description

5749 Updating DD 'VR' Nodes

CUSTODIAL PACKAGE: VA FILEMAN
SUBSCRIBING PACKAGE: LEXICON UTILITY

The Lexicon needs to be able to update the DD "VR" nodes during data updates. The Lexicon exports data in the export global ^LEXM. This export global is created by comparing the development account with a gold account and recording the changes in ^LEXM in the form of executable SET and KILL statements. Also recorded are the DD "VR" nodes.

Example of export global for patch LEX*2.0*80 for file 757.11:

^LEXM(757.11,4)=S ^DD(757.11,0,"VR")="2.0"
^LEXM(757.11,5)=S ^DD(757.11,0,"VRPK")="LEX"
^LEXM(757.11,6)=S ^DD(757.11,0,"VRRV")="80^3131001"

Example of export global for patch ICD*18.0*57 for file 80:

^LEXM(80,5391580)=S ^DD(80,0,"VR")="18.0"
^LEXM(80,5391581)=S ^DD(80,0,"VRPK")="ICD"
^LEXM(80,5391582)=S ^DD(80,0,"VRRV")="57^3131001"

Data installation is done by $ORDERing through the ^LEXM export global and executing the MUMPS code found in the global. When the above export global is installed at a site, the version number for file 757.11 is updated to 80 (for LEX*2.0*80) and given the effective date of the the ICD-10 implementation.
date. The effective date is not the date released, it is the date that the data becomes effective, and in this case it is the date the ICD-10 data is effective.

This activity only occurs during the post-install of an ICD, CPT or Lexicon KIDS Installation containing data. It is this method of exporting only the changes in a series of SET and KILL statements that allows for the distribution of large quantities of data without forcing users off the system.

1511 GMPTU
CUSTODIAL PACKAGE: LEXICON UTILITY
SUBSCRIBING PACKAGE: AUTOMATED INFO COLLECTION SYS
USAGE: Private ENTERED: MAR 8, 1996
STATUS: Active EXPIRES:
DURATION: Till Otherwise Agr VERSION:
FILE: ROOT:
DESCRIPTION: TYPE: Routine
The Automated Information Collection System has the ability to print lists of terms based on the Clinical Lexicon on Encounter Forms. When the forms are scanned and data is passed the PCE, the ICD9 diagnosis code associated with the term is required to populate the Purpose of Visit. This agreement is to allow AICS to use the call ICDONE^GMPTU (and its successor) ICDONE^LEXU to determine the correct, or best ICD9 Diagnosis code associated with the selected term. Input variable is the pointer to the clinical lexicon entry in file 757.01. Output is the ICD9 code, or null if none is found. This will be coded in such a way as when Clinical Lexicon converts to the LEX namespace that no changes will be required.

ROUTINE: GMPTU
COMPONENT: ICDONE
VARIABLES: INPUT Type: Input
The input to this function is the pointer to the Clinical Lexicon file (757.01) as the only parameter. This value is retrieved for other call to the clinical lexicon.

OUTPUT Type: Output
The function returns the ICD9 Diagnosis most appropriate for the term, or null if none exists.

Returns the best ICD9 code to associate with a clinical lexicon entry.

As a result, this file may be pointed to to retrieve the Display Text (.01) for both current Expressions and deactivated Expressions (Deactivation Flag 757.01;9 1;5 set to 1). This agreement is a follow-on to DBIA 457 (version 1.0) and is re-issued to include the package name, namespace and global root changes occurring in version 2.0. This is not an amendment to
LEXU is a utility routine for the Lexicon Utility which contains functions useful in retrieving classification code(s) for a term. This agreement is a follow-on to DBIA 10148 (version 1.0) and is re-issued to include the package name, namespace, routine name and global root changes occurring in version 2.0. This is not an amendment to 10148.

ROUTINE: LEXU

COMPONENT: $$ICDONE(IEN,DATE)

VARIABLES:  
IEN  Type: Input  
Internal Entry Number in the Expression file ^LEX(757.01).

DATE  Type: Input  
This is a date in Fileman format used to check if a code is active or inactive on a specified date. If not supplied, it will default to TODAY.

Returns either a single active ICD-9 code linked to the Lexicon expression or Null if no ICD-9 code is found.

COMPONENT: $$ICD(IEN,DATE)

VARIABLES:  
IEN  Type: Input  
Internal Entry Number in the Expression file ^LEX(757.01).

DATE  Type: Input  
This is a date in Fileman format used to check if a code is active or inactive on a specified date. If not supplied, it will default to TODAY.

Returns either a string of active ICD-9 codes linked to an expression (separated by semicolon, i.e., ICD;ICD;ICD) or Null if no ICD-9 codes are found.

COMPONENT: $$CPTONE(IEN,DATE)

VARIABLES:  
IEN  Type: Input  
Internal Entry Number in the Expression file ^LEX(757.01).
DATE Type: Input
This is a date in Fileman format used to check if a code is active or inactive on a specified date. If not supplied, it will default to TODAY.

Returns either a single active CPT-4 code linked to the Lexicon expression or Null if no CPT-4 code is found.

COMPONENT: $$DSMONE(IEN)
VARIABLES: IEN Type: Input
Internal Entry Number in the Expression file ^LEX(757.01).
Returns either a single DSM-IV code linked to the Lexicon expression or Null if no DSM-IV code is found.

COMPONENT: $$CPCONE(IEN,DATE)
VARIABLES: IEN Type: Input
Internal Entry Number in the Expressions file ^LEX(757.01).
DATE Type: Input
This is a date in Fileman format used to check if a code is active or inactive on a specified date. If not supplied, it will default to TODAY.
Returns either a single active HCPCS code linked to the Lexicon expression or Null if no HCPCS codes exist. HCPCS stands for Healthcare Financing Administration (HCFA) Common Procedure Coding System.

1597 INFO^LEXA Expression Information
CUSTODIAL PACKAGE: LEXICON UTILITY
SUBSCRIBING PACKAGE:
USAGE: Supported ENTERED: AUG 18, 1996
STATUS: Active EXPIRES:
DURATION: Till Otherwise Agr VERSION:
FILE: ROOT:
DESCRIPTION: TYPE: Routine
LEXA is used by the Lexicon Utility to perform a silent look-up and return an array of the expression found.

ROUTINE: LEXA
COMPONENT: INFO(IEN,DATE)
VARIABLES: IEN Type: Input
Internal Entry Number in the Expression file #757.01.
LEX Type: Output
The local array LEX("SEL") contains the major concept, synonyms, lexical variants, associated codes (i.e., ICD, CPT, DSM, etc.), the expression definition (if one exists), the semantic class, the semantic type, and all VA classification sources. See the Lexicon Utility's Technical Manual for a detailed description of this array.

DATE Type: Input
This is a date in Fileman format used to check if a code is active or inactive on
a specified date. If not supplied, it will default to TODAY. Active codes will be retrieved and displayed.

This entry point allows applications to retrieve information about an expression without conducting a search.

1599 LEXICON USER DEFAULTS - Filter LEXDFL

DESCRIPTION: TYPE: Routine

The entry point EN1^LEXDCC(LEXAP) will be used to setup user default display (classification codes) for conducting searches in the Lexicon Utility. This entry point along with EN1^LEXDFL, EN1^LEXDVO, EN1^LEXDCX and EN1^LEXDDS replaces ^GMPTDUSR used in version 1.0 of the Clinical Lexicon Utility (see DBIA 339).

ROUTINE: LEXDCC
COMPONENT: EN1(LEXAP)
VARIABLES: LEXAP Type: Input

LEXAP is the Internal Entry Number of the Subset Definition file (#757.2) where the application definition is located.

This entry point allows a single user to edit their default look-up display for the Lexicon Utility.

1603 LEXICON USER DEFAULTS – Vocabulary LEXDVD
CUSTODIAL PACKAGE: LEXICON UTILITY
SUBSCRIBING PACKAGE: PROBLEM LIST
USAGE: Private ENTERED: AUG 19, 1996
The entry point EN1^LEXDVO will be used to setup user default vocabulary for conducting searches in the Lexicon Utility. This entry point, along with EN1^LEXDFL, EN1^LEXDCC, EN1^LEXDCX and EN1^LEXDDS replaces ^GMPTDUSR used in version 1.0 of the Clinical Lexicon Utility (see DBIA 339).

ROUTINE: LEXDVO
COMPONENT: EN1(LEXAP)
VARIABLES: LEXAP  Type: Input
LEXAP is the Internal Entry Number of the Subset Definition file (#757.2) where the application definition is located.
This entry point allows a single user to edit their default look-up vocabulary for the Lexicon Utility.

1605  LEXICON USER DEFAULTS - Shortcuts LEXDCX
CUSTODIAL PACKAGE: LEXICON UTILITY
SUBSCRIBING PACKAGE: PROBLEM LIST
USAGE: Private  ENTERED: AUG 19, 1996
STATUS: Active
DURATION: Till Otherwise Agr
FILE: 
DESCRIPTION: TYPE: Routine
The entry point EN1^LEXDCX will be used to setup user default shortcuts by context for conducting searches in the Lexicon Utility. This entry point along with EN1^LEXDFL, EN1^LEXDCC, EN1^LEXDVO and EN1^LEXDDS replaces ^GMPTDUSR used in version 1.0 of the Clinical Lexicon Utility (see DBIA 339).

ROUTINE: LEXDCX
COMPONENT: EN1(LEXAP)
VARIABLES: LEXAP  Type: Input
LEXAP is the Internal Entry Number of the Subset Definition file (#757.2) where the application definition is located.
This entry point allows a single user to edit their default look-up shortcuts for the Lexicon Utility.

1607  LEXICON USER DEFAULTS - List LEXDDS
CUSTODIAL PACKAGE: LEXICON UTILITY
SUBSCRIBING PACKAGE: PROBLEM LIST
USAGE: Private  ENTERED: AUG 19, 1996
STATUS: Active
DURATION: Till Otherwise Agr
FILE: 
DESCRIPTION: TYPE: Routine
The entry point EN1^LEXDDS will be used to list user defaults for searching the Lexicon to a device (terminal or printer). This entry point along with EN1^LEXDFL, EN1^LEXDCC, EN1^LEXDVO and EN1^LEXDCX replaces ^GMPTDUSR used in version 1.0 of the Clinical Lexicon Utility (see DBIA 339).

ROUTINE: LEXDDS
COMPONENT: EN1(LEXAP)
VARIABLES: LEXAP Type: Input

LEXAP is the Internal Entry Number of the Subset Definition file (#757.2) where the application definition is located. This entry point allows a single user to list their Lexicon Utility defaults to a device (terminal or printer).

1609 Lexicon Setup LEXSET
CUSTODIAL PACKAGE: LEXICON UTILITY
SUBSCRIBING PACKAGE:
USAGE: Supported ENTERED: AUG 19,1996
STATUS: Active EXPIRES:
DURATION: Till Otherwise Agr VERSION:
FILE:
DESCRIPTION: TYPE: Routine
The Lexicon Utility uses LEXSET to setup search parameters based on applications definitions, subset definitions and user defaults stored in the Subsets Definition file (#757.2). These search parameters are stored in the global array ^TMP("LEXSCH",$J).

ROUTINE: LEXSET
COMPONENT: CONFIG(LEXNS,LEXSS,DATE)
VARIABLES: LEXNS Type: Input

LEXNS is an application identifier (formerly namespace) which tells the setup routines which application definition in file 757.2 to use to retrieve application defaults (i.e., global, display, filter, etc.). Acceptable values for LEXNS are found in file 757.2 in the "AN" index:

^LEXT(757.2,"AN",LEXNS)

LEXSS Type: Input

LEXSS is a subset identifier which tells the setup routines which subset definition in file 757.2 to use to retrieve subset and user defaults (i.e., global, display, filter, etc.). Acceptable values for LEXSS may be found in file 757.2 in either the "AA" or the "AB" indexes:

^LEXT(757.2,"AA",LEXSS)
^LEXT(757.2,"AB",LEXSS)

TMP(LEXSCH Type: Output

^TMP("LEXSCH",$J) is a global array used by the Lexicon Utility to control how a search of the Lexicon is to be conducted. It contains the following segments:

APP Application (from LEXNS)
DIS Display format
A detailed description of this global array may be found in the Lexicon Utility's Technical Manual.

DATE  Type: Input
This is a date in Fileman format used to check classification code codes to determine if they are active or inactive on the specified date. If not supplied, it will default to TODAY.

This entry point may be used by other applications to setup parameters for conducting a search of the Lexicon Utility.

1614  Lexicon Expressions for Codes LEXCODE
CUSTODIAL PACKAGE: LEXICON UTILITY
SUBSCRIBING PACKAGE:

Axlo: Supported  ENTERED: AUG 20, 1996
STATUS: Active  EXPIRES: 
DURATION: Till Otherwise Agr  VERSION: 
FILE:  ROOT: 
DESCRIPTION: TYPE: Routine

The Lexicon Utility uses the LEXCODE routine to extract expressions (terms) in the form of Fileman's output variable "Y" based on a classification code.

ROUTINE: LEXCODE
COMPONENT: EN(LEXSO, DATE)
VARIABLES: LEXSO  Type: Input

LEXSO is a classification code from one of several sources (i.e., ICD, CPT, DSM). A complete list of these sources can be found in the Lexicon Utility's Technical Manual.

LEXS(SAB, #) Type: Output
LEXS(SAB, #)=IEN^TERM is a local array containing references to expressions linked to the classification code. SAB refers to the three-character source abbreviation of the classification system (i.e., ICD-9-CM = ICD). A description of this array and a list of the source
abbreviations can be found in the Lexicon Utility's Technical Manual.

DATE  Type: Input

This is a date in Fileman format used to check if a code is active or inactive on a specified date. If not supplied, it will default to TODAY.

This entry point builds a local array containing expressions linked to an active classification code.

2288  Lexicon Utilities - LEXU
CUSTODIAL PACKAGE: LEXICON UTILITY
SUBSCRIBING PACKAGE:

USAGE: Supported   ENTERED: FEB 3,1998
STATUS: Withdrawn
DURATION: Till Otherwise Agr
FILE:
DESCRIPTION: TYPE: Routine

LEXU is a utility routine for the Lexicon Utility which contains functions useful in retrieving classification codes for a term. This agreement is an amendment to DBA #1573.

ROUTINE: LEXU
COMPONENT: $S$CPCONE(IEN)
VARIABLES: IEN  Type: Input

Internal Entry Number in the Expressions file ^LEX(757.01).

Returns either a single HCPCS code linked to the Lexicon expression or Null if no HCPCS codes exist. HCPCS stands for Healthcare Financing Administration (HCFA) Common Procedure Coding System.

2950  Lexicon Lookup LOOK^LEXA
CUSTODIAL PACKAGE: LEXICON UTILITY
SUBSCRIBING PACKAGE: ORDER ENTRY/RESULTS REPORTING

USAGE: Supported   ENTERED: APR 16,2003
STATUS: Active
DURATION: Till Otherwise Agr
FILE:
DESCRIPTION: TYPE: Routine

This entry point is silent and intended to support Graphical User Interface (GUI) development. The lookup returns an array of information on the expressions found. The lookup includes reordering the selection list with the most frequently used at the top, and places any exact match at the top of the list.

ROUTINE: LEXA
COMPONENT: LOOK(LEXX,LEXAP,LEXLL,LEXSUB,DATE)
VARIABLES: LEXX  Type: Input

Equivalent to Fileman's variable X and contains the text to search for.

LEXAP  Type: Input

This is the application identification and may be in the form of a name, namespace, or a pointer (Internal Entry Number - IEN) from an application.
definition in the Subset Definition file (#757.2).

The default value for this parameter, if it is not supplied, is the one (1), pointing to the Lexicon application definition.

Included in this application definition are a number of application defaults which assist in searching the Lexicon. Application defaults included the global root, index, filter, display format, vocabulary, shortcuts, user default flag, overwrite user default flag, and the unresolved narrative flag. These are described in the Special Variable section of the Lexicon Utility Technical Manual.

At this time, there are six (6) application definitions.

<table>

</tbody>
</table>

To conduct a search of the Lexicon using the application defaults for the Problem List, you may pass this parameter as:

**Name** "PROBLEM LIST" - This form is not case sensitive, and can be found either the "B" or "C" index of file 757.2.

**Namespace** "GMPL" - Namespace - This form is not case sensitive, and can be found in the "AN" index of file 757.2.

**Pointer** 4 - This form is numeric, and is an Internal Entry Number (IEN) of file 757.2.

**LEXLL** Type: Input

This is a numeric value which controls the returning list length in the local array LEX("LIST"). The default value for this parameter when not supplied is five (5).

**LEXSUB** Type: Input
This parameter represents the vocabulary subset to use during the search. These subsets are defined in the Subset Definition file (#757.2). This parameter may be in one of three forms. To use the "Nursing" subset you may pass the parameter as:

Name       "NURSING" - This form is not case sensitive and may be found in either the "B" or "C" index of file 757.2.

Mnemonic   "NUR" - This form is not case sensitive and the mnemonic may be found in either the "AA" or "AB" index of file 757.2.

Pointer    2 - This form is numeric, and is an Internal Entry Number (IEN) of file 757.2.

**TMP** Type: Output

`^TMP("LEXFND",$J,<freq>,<ien>)`

This global array contains all of the entries found during the search. The `<freq>` is a negative number based on the frequency of use for a given term. `<ien>` is the internal entry number in the Lexicon Expression file (757.01).

`^TMP("LEXHIT",$J,<seq>)`

This global array contains the entries reviewed by the user. The Lexicon Utility reorders the list based on frequency of use and assigns a sequence number representing where on the list this entry is located.

**LEX** Type: Output

`LEX("LIST")`

This local array contains only those entries on the list which are currently being reviewed by the user. The third parameter to the look-up defines the length of this list.

**DATE** Type: Input

This is a date in Fileman format used to check if a code is active or inactive on a specified date. If not supplied, it will default to TODAY. Only active codes can be displayed and returned during a lookup.
4083  Lexicon Code Status - LEXSRC2

</table>

LEX  Type: Output

(Optional) This is a local array passed by reference. If passed it will contain information about the code in the following formatted subscripts:

LEX(0) = <ien 757.02> ^ <code>

2-piece String containing the IEN of the code and the code
This entry point is used to check the activation status of a code in the Lexicon Utility.

4306 LEXICAL SERVICES UPDATE Protocol

CUSTODIAL PACKAGE: LEXICON UTILITY
SUBSCRIBING PACKAGE: DRG GROUPER

The subscribing protocol is: ICD CODE UPDATE EVENT
CPT/HCPCS CODES

The subscribing protocol is: ICPT CODE UPDATE EVENT

USAGE: Controlled Subscri ENTERED: DEC 3,2003
STATUS: Active EXPIRES:
DURATION: Till Otherwise Agr VERSION:
FILE: ROOT:
DESCRIPTION: TYPE: Other

This protocol is used to notify other applications and processes when the Lexicon Utility or the Lexicon Change file is updated.

The Lexicon is updated using a temporary maintenance global, ^LEXM. This global is processed by the routine LEXXGI. Once processed, this protocol is triggered and the global ^LEXM is deleted.

Required Variable LEXSCHG Array contains a listing of those Lexicon Files (#757 - 757.41) that were updated as a result of a recent install. In the case of the CHANGE LOG (file #757.9), new changes to SDO controlled files will be indicated by file number and the internal entry number to the CHANGE LOG.

The variable LEXSCHG is created while processing the Lexicon Maintenance global ^LEXM. It will indicate what files were updated.

Example:

LEXSCHG(757,0)=""
LEXSCHG(757.001,0)=""
LEXSCHG(757.01,0)=""
LEXSCHG(757.02,0)=""
LEXSCHG(757.1,0)=""
LEXSCHG(757.11,0)=""
LEXSCHG(757.9,0)=""
LEXSCHG(757.9,2)=80
LEXSCHG(757.9,3)=80.1
LEXSCHG(757.9,4)=81
If ICD-9-CM and/or CPT-4 changes are included in the ^LEXM global, then the following entries will be found in the local array LEXSCHG:

LEXSCHG(80,0)=""
LEXSCHG(80.1,0)=""
LEXSCHG(81,0)=""

4912 Concept Data for Code - LEXTRAN
CUSTODIAL PACKAGE: LEXICON UTILITY
SUBSCRIBING PACKAGE:

USAGE: Supported ENTERED: OCT  5,2006
STATUS: Active EXPIRES:
DURATION: Till Otherwise Agr VERSION:
DESCRIPTION: TYPE: Routine

This API will return an array of data for a given code, code source, optional date, and optional return array name. The data returned will include:

code
hierarchy or subset (if available)
version (if available)
legacy code (if available)
code status
fully specified name (if available)
preferred term
any applicable synonyms

If any of the data in the passed parameters data is incorrect or unrecognizable, the API will return an error message indicating the nature of the error. If no date is specified, then the date will default to the current system date. This API was developed specifically for the SNOMED CT code system in support of the LDSI project, but is applicable to any code system.

ROUTINE: LEXTRAN
COMPONENT: $$CODE(CODE,SRC,VDT,ARRAY,IENS,ID,INC)
VARIABLES: Input CODE

This is a code of a classification system that is stored in the Lexicon. Classification systems include SNOMED CT, ICD, CPT, HCPCS, etc.

VARIABLES: Input SRC

This is the mnemonic for a code system (mandatory). The allowable code system mnemonics are those that exist in the "B" index of the coding systems file (757.03) This is code system source abbreviation Lexicon.

VARIABLES: Input VDT

This is the effective date; the default if no date is specified is the current system date (optional).
VARIABLES: Both ARRAY

This is the name of the output array. The default, if no array name is specified, is 'LEX' (optional).
The format of the output is as follows:

Output

if call finds an active code for the source
"1^LEXCODE"
LEX - an array containing
information about the code
LEX(0) - a five piece string:
1. code
2. hierarchy
3. version
4. legacy code
5. code status
LEX("F") fully specified name
LEX("P") preferred term
LEX("S",n) synonyms (n is the nth synonym)

if call cannot find specified code on file
"-2^_LEXSCNM_" code "_LEXCODE_" not on file"
where LEXSCNM is the source name
LEXCODE is the code

if call finds an inactive code for the source
"-4^_LEXSCNM_" code "_LEXCODE_" not active for "_LEXVDT"
LEX - an array containing
information about the code
LEX(0) - a five piece string:
1. code
2. hierarchy
3. version
4. legacy code
5. code status

otherwise
"-1^error text"

example of LEX array:

LEX(0)="67922002^Substance^20050701^T-C2500^1"
LEX("F")="Serum (Substance)"
LEX("P")="Serum"

VARIABLES: Input IENS

Include expression IENS in output array (optional)
1 return IENS (2nd piece)
0 do not return IENS (default)

VARIABLES: Input ID

Designation Identifiers (optional)
1 return Designation IDs (3rd piece)
0 do not return Designation IDs (default)

VARIABLES: Input INC
Include Deactivated Terms (optional)
1 return Deactivated Terms
0 do not return Deactivated Terms (default)

4913  Concept Data for Text - LEXTRAN
CUSTODIAL PACKAGE: LEXICON UTILITY
SUBSCRIBING PACKAGE:
USAGE: Supported            ENTERED: OCT 5, 2006
STATUS: Active              EXPIRES:
DURATION: Till Otherwise Agr VERSION:
FILE:                        ROOT:
DESCRIPTION: TYPE: Routine
This API will return an array of data for a given text, optional code
source, optional date, optional subset, and optional return array name.
The API will display a pick list based on the parameters passed and allow
a user to select an item from the list. The API will then return the array
for the item selected. The data returned will include:
  code
  hierarchy or subset (if available)
  version (if available)
  legacy code (if available)
  code status
  fully specified name (if available)
  preferred term
  any applicable synonyms

If any of the data in the ‘passed’ parameters data is incorrect or
unrecognizable, the API will return an error message indicating the nature
of the error. If no date is specified, then the date will default to the
current system date. This API was developed specifically for the SNOMED
CT code system in support of the LDSI project, but is applicable to any
code system.

ROUTINE: LEXTRAN
COMPONENT: $$TEXT(TEXT,DATE,SUBSET,SOURCE,ARRAY)
VARIABLES: TEXT  Type: Input
            This is the search text string
            (mandatory).

SUBSCRIBING PACKAGE:

USAGE: Supported  ENTERED: OCT 5, 2006
STATUS: Active  EXPIRES:
DURATION: Till Otherwise Agr  VERSION:
FILE:  ROOT:
DESCRIPTION:  TYPE: Routine

This API will return an array for a given text and code system indicating whether the text is valid for the specified code system. The data array returned will include the following:

- An indicator of whether the text is valid for the code system
- The code in the code system to which the text, if valid for code system, belongs. If any of the passed parameters are incorrect or unrecognizable, the API will return an error message indicating the nature of the error.

ROUTINE: LEXTRAN
COMPONENT: $$TXT4CS(TEXT,SOURCE)
VARIABLES: TEXT Type: Input

This is the search text string (mandatory).

SOURCE Type: Input

This is the mnemonic for a code system (mandatory). The allowable code system mnemonics are those that exist in the "B" index of the coding systems file (757.03).

Type: Output

This API returns the following output:

1^code
or
-1^error message

5006 Obtain Synonyms for Code – LEXTRAN1

CUSTODIAL PACKAGE: LEXICON UTILITY

SUBSCRIBING PACKAGE:

STATUS: Active  EXPIRES:
DURATION:  VERSION:
DESCRIPTION:  TYPE: Routine

This API will return an array for a given code and coding system. The array will contain all synonyms for the concept including the preferred term and the fully specified name. If any of the passed parameters are incorrect or unrecognizable, the API will return an error message indicating the nature of the error.

ROUTINE: LEXTRAN1
COMPONENT: $$GETSYN(SRC,CODE,VDT,ARRAY,IENS,ID,INC)
VARIABLES: Input SRC

This is the mnemonic for a code system (mandatory). The allowable code system mnemonics are those that exist in the "B" index of the
coding systems file (757.03) This is code system source abbreviation Lexicon.

**VARIABLES:** Input **CODE**

This is a code of a classification system that is stored in the Lexicon. Classification systems include SNOMED CT, ICD, CPT, HCPCS, etc.

**VARIABLES:** Input **VDT**

This is the effective date; the default if no date is specified is the current system date (optional).

**VARIABLES:** Both **ARRAY**

This is the name of the output array. The default, if no array name is specified, is 'LEX' (optional)

The format of the output is as follows:

- If valid code and source are passed
  - "1"no of synonyms"
  - LEX("F") = preferred term or major concept name^IEN
  - LEX("F") = fully specified name^IEN (if one exists)
  - LEX("S",n) = the nth synonym found^IEN (if they exist)

The presence of IEN in the return array is determined by the LEXIENS parameter. If the call does not find the code for the specified source it will return 

- "2"_LEXSCNM_ code _LEXCODE_ not on file" where LEXCSNM is the source name LEXCODE is the code If an invalid source is passed the call will return 

- "1"source not recognized"

**VARIABLES:** Input **IENS**

If this parameter is set to 1 the expression IEN will be included in the return array. Default is 0 - exclude IENS from return array.

**VARIABLES:** Input **ID**

Designation Identifiers (optional)
- 1 return Designation IDs (3rd piece)
- 0 do not return Designation IDs (default)

**VARIABLES:** Input **INC**

Include Deactivated Terms (optional)
- 1 return Deactivated Terms
- 0 do not return Deactivated Terms (default)

---

**5007 Obtain Fully Specified Name – LEXTRAN1**

This API returns the fully specified name for a given coding system and
code. If any of the passed parameters are incorrect or unrecognizable, the API will return an error message indicating the nature of the error.

ROUTINE: LEXTRAN1
COMPONENT: GETFSN(LEXSRC, LEXCODE, LEXVDT)
VARIABLES: LEXSRC  Type: Input
This is the mnemonic for a coding system (mandatory). The allowable code system mnemonics are those that exist in the "B" index of the coding systems file (757.03). This is the code system source abbreviation Lexicon.

LEXCODE  Type: Input
This is a code that belongs to a coding system that is stored in the Lexicon. Coding systems include SNOMED CT, ICD, CPT, HCPCS, etc.

LEXVDT  Type: Input
This is the effective date; the default if no date is specified is the current system date (optional).

5008 Obtain Preferred Term – LEXTRAN1
CUSTODIAL PACKAGE: LEXICON UTILITY
SUBSCRIBING PACKAGE:

5009 Obtain Designation Code – LEXTRAN1
CUSTODIAL PACKAGE: LEXICON UTILITY
SUBSCRIBING PACKAGE:
This API returns the designation code for a given coding system and text. If any of the passed parameters are incorrect or unrecognizable, the API will return an error message indicating the nature of the error.

ROUTINE: LEXTRAN1
COMPONENT: $$GETDES(LEXSRC)
VARIABLES: LEXSRC Type: Input
This is the mnemonic for a code system (mandatory). The allowable code system mnemonics are those that exist in the "B" index of the coding systems file (757.03). This is the Lexicon code system source abbreviation.

LEXTEXT Type: Input
This is the displayable text of the expression for which the designation code is being sought (mandatory).

LEXVDT Type: Input
This is the effective date; the default if no date is specified is the current system date (optional).

COMPONENT: $$GETDES(LEXSRC,LEXCODE,LEXVDT)

5010 Obtain Mapped Codes – LEXTRAN1
CUSTODIAL PACKAGE: LEXICON UTILITY
SUBSCRIBING PACKAGE:

This API returns an array containing the mappings for a specified code for a specified mapping identifier. If any of the passed parameters are incorrect or unrecognizable, the API will return an error message indicating the nature of the error.

ROUTINE: LEXTRAN1
COMPONENT: GETASSN(LEXCODE,LEXMAP,LEXVDT,LEXRAY)
VARIABLES: LEXCODE Type: Input
This is a code belonging to a coding system that is stored in the Lexicon. Coding systems include SNOMED CT, ICD, CPT, HCPCS, etc.

LEXMAP Type: Input
This is the mapping identifier (mandatory). This allows the system to determine which map is to be used for translation. The map must be defined in the mapping definition file (757.32).

LEXVDT Type: Input
This is a code belonging to a coding
system that is stored in the Lexicon. Coding systems include SNOMED CT, ICD, CPT, HCPCS, etc.

LEXRAY Type: Both

This is the name of the output array. The default, if no array name is specified, is 'LEX' (optional). The output array will have the following format:

```
LEX(n,CODE)=""
```

where n is the nth mapped code

code is the code which is mapped to

e.g.

```
LEXVFL>S
V=$$GETASSN(15250008,"SCT2ICD") ZW LEX
LEX=2
LEX(1,"371.30")=""
LEX(2,"371.40")=""
```

which shows that SNOMED CT code 15250008 is mapped to two ICD-9-CM codes.

5011 Obtain Version Identifier - LEXTRAN

CUSTODIAL PACKAGE: LEXICON UTILITY

SUBSCRIBING PACKAGE:

<table>
<thead>
<tr>
<th>USAGE</th>
<th>ENTERED: JUN 28,2007</th>
</tr>
</thead>

<tr>
<td>FILE:</td>
<td>ROOT:</td>
</tr>
<tr>
<td>DESCRIPTION:</td>
<td>TYPE: Routine</td>
</tr>
</tbody>
</table>

This API returns the SDO version identifier for a given coding system, code, and date. If any of the passed parameters are incorrect or unrecognizable, the API will return an error message indicating the nature of the error.

ROUTINE: LEXTRAN

COMPONENT: $$VERSION(LEXSRC,LEXCODE,LEXVDT)

VARIABLES: LEXSRC Type: Input

This is the mnemonic for a coding system (mandatory). The allowable coding system mnemonics are those that exist in the "B" index of the coding systems file (757.03). This is the Lexicon coding system source abbreviation.

LEXCODE Type: Input

This is a code belonging to a coding system that is stored in the Lexicon. Coding systems include SNOMED CT ICD-9-CM, CPT, HCPCS, etc.

LEXVDT Type: Input

This is the effective date; the default if no date is specified is the current system date (optional).
LEXASCD contains APIs for supporting the Automated Service Connected Designation (ASCD) project.

**ROUTINE: LEXASCD**

**COMPONENT:** \$SC(ICD,VBA,EFF,.ARY)

**VARIABLES:**

- **ICD** Type: Input
  
  (Required) ICD-9-CM Diagnosis Code

- **VBA** Type: Input
  
  (Required) VA Disability code (Title 38)

- **EFF** Type: Input
  
  (Optional) Effective Date – This is the date that service was provided to the patient (aka, encounter date) and is used to check to see if the ICD code was mapped to the Disability code on that date.

- **.ARY** Type: Input
  
  (Optional) This is a local array, passed by reference. When passed it will return information about the ICD code and Disability codes.

- **\$SC** Type: Output
  
  If the ICD code is mapped to a VA disability, then the return value is a 5 piece "^^" delimited string as follows:

<table>
<thead>
<tr>
<th>#</th>
<th>Content</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Service Connected</td>
<td>1=Yes</td>
</tr>
<tr>
<td>2</td>
<td>Connection (Match)</td>
<td>1=Full 0=Partial</td>
</tr>
<tr>
<td>3</td>
<td>Mapping Status</td>
<td>1=Active 0=Inactive</td>
</tr>
<tr>
<td>4</td>
<td>ICD Code Status</td>
<td>1=Active 0=Inactive</td>
</tr>
<tr>
<td>5</td>
<td>Code Status</td>
<td>1=Active 0=Inactive</td>
</tr>
</tbody>
</table>

  If the ICD Code is not mapped to a VA disability, then the return value is a negative 2 piece "^^" delimited string as follows:
-1 ^ Not Found or Error Message

ARY  Type: Output

(Optional) This is a local array passed by reference. If passed it will contain detailed information about the ICD code and Disability code. The local array will contain the following 2 subscripts:

ARY(1)=<ICD status>^<Date>^<Code>^<Term>
ARY(2)=<Disability status>^<Date>^<Code>^<Term>

Where status is either a 1 (active) or 0 (inactive) and date is the effective date the code became either active or inactive.

This function determines if there is a partial or full service connection for an ICD code based on the ICD codes and disability codes in the Lexicon.

COMPONENT: $$DI(ICD,EFF,ARY)

VARIABLES:

ICD  Type: Input
(Required) ICD-9-CM Code

EFF  Type: Input
(Optional) Effective Date (default TODAY)

ARY  Type: Input
(Optional) Local array passed by reference, returns a list of Disability codes mapped to the ICD code.

$$DI  Type: Output
Returns the number of Disability codes mapped to an ICD code.

ARY  Type: Output
(Optional) Local Array of Disability Codes passed by reference

ARY(0) = 5 Piece String detailing input Diagnosis code

1   Number of Disability Codes found
2   ICD Code
3   Status of ICD Code  1 = Active 0 = Inactive
4   Effective Date of ICD Code Status
5   Versioned Text of ICD Code

ARY(#) = 6 Piece String detailing output Disability codes

1   Mapping 1 = Full 0 = Partial
2   Effective Date of Mapping
Return the number of Disability codes an ICD code is mapped to. Optionally return an array of Disability codes an ICD code is mapped to in a local array passed by reference.

**COMPONENT:** $$DX(VBA, EFF, ARY)$$

**VARIABLES:**

- **VBA** Type: Input
  (Required) Disability Code (Title 38)

- **EFF** Type: Input
  (Optional) Effective Date (default TODAY)

- **.ARY** Type: Input
  (Optional) Local array passed by reference, return a list of ICD codes mapped to a Disability code.

**$$DX** Type: Output

The number of Diagnosis codes mapped to a Disability code.

**ARY** Type: Output

(Optional) Local Array of Diagnosis Codes passed by reference

ARY(0) = 5 Piece String detailing input Disability code

1 Number of Diagnosis Codes found
2 Disability Code
3 Status of Code 1 = Active 0 = Inactive
4 Effective Date of Disability Code

**Status**

5 Versioned Text of Disability Code

ARY(#) = 6 Piece String detailing output Diagnosis codes

1 Mapping 1 = Full 0 = Partial
2 Effective Date of Mapping
3 ICD-9-CM Code
4 Status of ICD-9-CM Code
5 Effective Date of ICD-9-CM Code

**Status**

6 Versioned Text of ICD-9-CM Code
ARY("B",MAP,#)=""  Index of Local Array

MAP Mapping 1 = Full 0 = Partial
#   Entry Number in Array

Return the number of ICD Diagnosis codes a Disability code is mapped to. Optionally return an array of ICD codes a Disability code is mapped to in a local array passed by reference.

5386  Lexicon Lookup Screens - LEXU

CUSTODIAL PACKAGE: LEXICON UTILITY
SUBSCRIBING PACKAGE:

USAGE: Supported  ENTERED: MAR 13, 2009
STATUS: Active  EXPIRES:
DURATION: Till Otherwise Agr  VERSION:
FILE:  ROOT:
DESCRIPTION:  TYPE: Routine

This agreement includes common entry points for filtering Lexicon searches. Similar to DIC("S") screens.

ROUTINE: LEXU
COMPONENT:  $$SC(Y,STRING,DATE)
VARIABLES:  Y  Type: Input
STRING  Type: Input

This is an Internal Entry Number (IEN) of the Lexicon's EXPRESSION file 757.01.

This is a three piece ";" delimited string used by the filter/screen logic. The first piece is called the "inclusion string" and list the Semantic Classes and Types to include in the search. The second piece is called the "exclusion string" and list the Semantic Types to exclude from a search. The third piece is called the "source string" and list classification sources to include in the search.

Detailed Example: Problems and Diagnosis (including ICD, CPT and DSM) looks like this:

I

$$SC^LEXU(Y,"BEH/DIS;999/64/66/73/74/77/82/169/170/171;ICD/CPT/CPC/DSM",DATE)

The full explanation:
Piece 1: BEH/DIS Include expressions which relate to Behaviors and Diseases or Pathologic Processes.

Piece 2: 999/64/66/73/74/77/82/169/170/171 Exclude expressions which relate to Unknown or Untyped, Governmental or Regulatory Activity, Machine Activity, Manufactured Object, Medical Device or Supplies, Conceptual Entity, Spatial Concept, Functional Concept, Intellectual Product and Language.

Piece 3: ICD/CPT/CPC/DS4 Also include expressions which are linked to ICD-9-CM, CPT-4, HCPCS and coding systems.

In the filter string, Semantic Classes are identified by a 3 character mnemonic which can be found in the "B" cross-reference of the SEMANTIC CLASS file 757.11 and the Semantic Type is identified by internal entry number of the SEMANTIC TYPE file 757.12. The coding systems are identified by a 3 character mnemonic which can be found in the "ASAB" cross-reference of the CODING SYSTEMS file 757.03.

DATE Type: Input

If applicable, this is the date service was provided to the patient and passed in Fileman format. Default is TODAY.

This entry point filters Lexicon searches based on Semantic Class/Types and Classification Codes.

DIC("S")/Screen Usage:  I $$SC^LEXU(Y,STRING,DATE)

COMPONENT: $$SO(Y,STRING,DATE)

VARIABLES: Y Type: Input

This is an Internal Entry Number (IEN) of the Lexicon's EXPRESSION file 757.01.

STRING Type: Input

This string is called the "source string" and is a list classification coding systems to include in the search. The classification coding systems are identified by a 3 character mnemonic which can be found in the "ASAB" cross-reference of the CODING SYSTEMS file 757.03.

Example: ICD/CPT/CPC/DS4 Means: Search the Lexicon and include terms that
are linked to ICD-9-CM, CPT-4, HCPCS and DSM-4 coding systems.

DATE Type: Input

If applicable, this is the date service was provided to the patient and passed in Fileman format. Default is TODAY.

This entry point filters Lexicon searches based on Classification Codes.

DIC("S")/Screen Usage: I $$SO^LEXU(Y,STRING,DATE)

5547 LAB LOINC File #95.3 APIs - LEXLR

CUSTODIAL PACKAGE: LEXICON UTILITY
SUBSCRIBING PACKAGE: DSS EXTRACTS
LAB SERVICE

USAGE: Controlled Subcri ENTERED: JUL 23, 2010
STATUS: Pending EXPIRES:
DURATION: VERSION:
FILE: ROOT:
DESCRIPTION: TYPE: Routine

These API(s) support the custodial transition of the LAB LOINC file (#95.3) from Legacy LAB to Standards and Terminology Services (STS). These API(s) provide Read Access to the LAB LOINC file (#95.3) and should be used when accessing the file. The API(s) support Legacy LAB's encapsulation efforts and STS's LOINC Deployment efforts.

ROUTINE: LEXLR
COMPONENT: $$CHKCODE(LEXCODE)

          RECORD("CHALLENGE")
          RECORD("CHANGETYPE")
          RECORD("CLASS")
          RECORD("CLASSTYPE")
          RECORD("CODE")
          RECORD("COMPONENT")
          RECORD("DATELASTCHANGED")
          RECORD("EXAMPLEUNITS")
          RECORD("FULLNAME")
          RECORD("MAPTO")
          RECORD("METHODTYPE")
Get LOINC Record Array by Code or IEN

Example:

```plaintext
>D GETREC^LEXLR("38553-4",.,LEXREC)
ZW LEXREC
LEXREC("ADJUSTMENT")=""
LEXREC("CHALLENGE")=""
LEXREC("CHANGETYPE")="ADD"
LEXREC("CLASS")="SERO"
LEXREC("CLASSTYPE")="1^LABORATORY"
LEXREC("CODE")="38553-4"
LEXREC("COMPONENT")="NARCOLEPSY ASSOCIATED AG"
LEXREC("DATELASTCHANGED")="3041103^NOV 03, 2004"
LEXREC("EXAMPLEUNITS")=""
LEXREC("FULLNAME")="NARCOLEPSY ASSOCIATED AG:ACNC:PT:SER/PLAS:ORD"
LEXREC("MAPTO")=""
LEXREC("METHODOLOGY")=""
LEXREC("PROPERTY")="ACNC"
LEXREC("SCALETYPE")="Ordinal"
LEXREC("SHORTNAME")="Narcolepsy Assoc Ag SerPl Ql"
LEXREC("STATUS")=""
LEXREC("SYSTEM")="SER/PLAS"
LEXREC("TIME")="POINT"
LEXREC("VACODE")=""
LEXREC("VUID")=4681780
```

COMPONENT: `$$VERSION()`

VARIABLES: `$$VERSION` Type: Output

LOINC Version or Null

Get LOINC Version

Example:

```plaintext
>W $$VERSION^LEXLR()
2.14
```

COMPONENT: `COMLIST(LEXCOM, LEXARR)`

VARIABLES: `LEXCOM` Type: Input

Component field (#100)

LEXARR Type: Input

Component List Array (Full Global Reference)

Note: LEXARR is not initialized (ie KILLED on input)

The calling application is responsible for initializing the array.

@LEXARR@L Type: Output
Component List Array

@LEXARRAY@(LEXCODE)=Fully Specified Name field (#80)

Get List by Component

Example:

>D COMLST^LEXLR("VIRUS IDENTIFIED","LEXARRAY")
ZW LEXARRAY
LEXARRAY("10736-7")="VIRUS IDENTIFIED:PRID:PT:CSF:NOM:MICROSCOPY ELECTRON"
LEXARRAY("10737-5")="VIRUS IDENTIFIED:PRID:PT:STL:NOM:MICROSCOPY ELECTRON"
LEXARRAY("10738-3")="VIRUS IDENTIFIED:PRID:PT:TISS:NOM:MICROSCOPY ELECTRON"
LEXARRAY("10739-1")="VIRUS IDENTIFIED:PRID:PT:XXX:NOM:MICROSCOPY ELECTRON"
LEXARRAY("11484-3")="VIRUS IDENTIFIED:PRID:PT:AMN:NOM:VIRUS CULTURE"
LEXARRAY("12272-1")="VIRUS IDENTIFIED:PRID:PT:XXX:NOM:IF"
LEXARRAY("14451-9")="VIRUS IDENTIFIED:PRID:PT:EYE:NOM:VIRUS CULTURE"
LEXARRAY("14452-7")="VIRUS IDENTIFIED:PRID:PT:CVX:NOM:VIRUS CULTURE"
LEXARRAY("14453-5")="VIRUS IDENTIFIED:PRID:PT:GENV:NOM:VIRUS CULTURE"
LEXARRAY("14454-3")="VIRUS IDENTIFIED:PRID:PT:NOSE:NOM:VIRUS CULTURE"
LEXARRAY("14455-0")="VIRUS IDENTIFIED:PRID:PT:PLR:NOM:VIRUS CULTURE"
LEXARRAY("14456-8")="VIRUS IDENTIFIED:PRID:PT:PR: NOM:VIRUS CULTURE"
LEXARRAY("14457-6")="VIRUS IDENTIFIED:PRID:PT:UR:NOM:VIRUS CULTURE"
LEXARRAY("14458-4")="VIRUS IDENTIFIED:PRID:PT:SPT:NOM:VIRUS CULTURE"

COMPONENT: DEPLST(LEXARR)
VARIABLES: LEXARR Type: Input

Deprecated List Array (Full Global Reference)

Note: LEXARR is not initialized (ie KILLED) on input
The calling application is responsible for initializing the array.

@LEXARR@(L Type: Output

Depreciated List Array

@LEXARR@(LEXCODE)=Fully Specified Name field (#80)

Get Deprecated List

5679 Lexicon Utilities - LEXU (ICD-10 UPDATE)
CUSTODIAL PACKAGE: LEXICON UTILITY

SUBSCRIBING PACKAGE:

USAGE: Supported ENTERED: JUN 3, 2011
STATUS: Pending EXPIRES:
DURATION: Till Otherwise Agr VERSION:

DESCRIPTION: TYPE: Routine
This is an addendum to ICR 1573 and contains functions added to LEXU during the implementation of ICD-10 Coding system. The APIs in this ICR become effective on the date of release of patches ICD*18.0*57 and LEX*2.0*80.

ROUTINE: LEXU

COMPONENT: $$D10ONE(IEN,DATE)

Returns either a single active ICD-10 Diagnosis code linked to the Lexicon expression or Null if no ICD-10 Diagnosis code is found.

VARIABLES: 
Input IEN Internal Entry Number in the Expression file \^LEX(757.01).

VARIABLES: 
Input DATE This is a date in Fileman format used to check if a code is active or inactive on a specified date. If not supplied, it will default to TODAY.

VARIABLES: 
Output $$D10ONE A single active ICD-10 Diagnosis code or Null if no ICD-10 Diagnosis code is found.

COMPONENT: $$D10(IEN,DATE)

Returns either a string of active ICD-10 Diagnosis codes linked to an expression (separated by semicolon, i.e., ICD10;ICD10;ICD10) or Null If no ICD-10 Diagnosis codes are found.

VARIABLES: 
Input IEN Internal Entry Number in the Expression file \^LEX(757.01).

VARIABLES: 
Input DATE This is a date in Fileman format used to check if a code is active or inactive on a specified date. If not supplied, it will default to TODAY.

VARIABLES: 
Output $$D10 A string of active ICD-10 Diagnosis codes linked to an expression (separated by semicolon, i.e., ICD.10;ICD.10;ICD.10) or Null if no ICD-10 Diagnosis codes are found.

COMPONENT: $$P10ONE(IEN,DATE)

Returns either a single active ICD-10 Procedure code linked to the Lexicon expression or Null if no icd-10 Procedure code is found.
VARIABLES: Input  
IEN
Internal Entry Number in the Expression file ^LEX(757.01).

VARIABLES: Input  
DATE
This is a date in Fileman format used to check if a code is active or inactive on a specified date. If not supplied, it will default to TODAY.

VARIABLES: Output  
$$P10ONE
A single active ICD-10 Procedure code or Null if no ICD-10 Procedure code is found.

COMPONENT: $$ONE(IEN,DATE,SAB)
Returns a single code for a given internal entry number (IEN) for a specified date and source.

VARIABLES: Input  
IEN
Internal Entry Number in the Expression file ^LEX(757.01).

VARIABLES: Input  
DATE
This is a date in Fileman format used to check if a code is active or inactive on a specified date. If not supplied, it will default to TODAY.

VARIABLES: Input  
SAB
Source, this is an internal entry number in file 757.03 or the 3 character source mnemonic (found on the ASAB cross-reference in file 757.03) or the SOURCE ABBREVIATION (.01 field in file 757.03)

VARIABLES: Output  
$$ONE
A single code belonging to the specified coding system by the source abbreviation that is active on the dated provided and assigned to the expression indicated by the internal entry number (IEN).

COMPONENT: $$ALL(IEN,DATE,SAB)
Returns all classification codes for a given internal entry number (IEN) for a specified date and source.

VARIABLES: Input  
IEN
Internal Entry Number in the Expression file ^LEX(757.01).

VARIABLES: Input  
DATE
This is a date in Fileman format used to check if a code is active or inactive on a specified date. If not supplied, it will default to TODAY.

VARIABLES: Input  
SAB
Source, this is an internal entry number in file 757.03 or the 3 character source mnemonic (found on the ASAB cross-reference in file 757.03) or the SOURCE ABBREVIATION (.01 field in file 757.03)
VARIABLES: Output $$ALL
A string of codes for the source provided (one or more) delineated by a semi-colon or null if no codes are found for the source.

COMPONENT: $$IMPDATE(SAB)
This entry point (extrinsic function) returns the implementation date for a specified source.

VARIABLES: Input SAB
Source, this is an internal entry number in file 757.03 or the 3 character source mnemonic (found on the ASAB cross-reference in file 757.03) or the SOURCE ABBREVIATION (.01 field in file 757.03)

VARIABLES: Output $$IMPDATE
The date that a coding system was implemented in VistA in Fileman format.

COMPONENT: $$CSYS(SYS,VDT)
This entry point returns information about a coding system on file in the Coding System file #757.03.

VARIABLES: Input SYS
Coding system identification system and can be in any of the following formats:

A nickname if one exist, i.e. HCPCS, DSM, NANDA, BIRADS

First three characters of source abbreviation from file 757.03, field .01

Source Abbreviation (file 757.03, field .01), i.e., ICD9, CPT4, SNM2

Nomenclature (file 757.03, field 1), i.e., ICD-9-CM, ICD-10-PCS, NANDA

Type (only for ICD), i.e., "DIAG" or "PROC" (requires date)

VARIABLES: Input VDT
Versioning date in Fileman format used to determine coding system if only the type is known (DIAG or PROC) and to determine the correct SDO version if one exists. If the date is not passed, then TODAY is used.

VARIABLES: Output $$CSYS
A 13 piece caret (^) delimited string

1 IEN
2 SAB (3 character source abbreviation)
3 Source Abbreviation (3-7 char) (#.01)
4 Nomenclature (2-11 char) (#1)
COMPONENT: $$HIST(CODE,SYS,.ARY)
This entry point returns a codes activation history in an array passed by reference.

VARIABLES: Input CODE
This is a classification code found in the CODES file 757.02 (Required)

VARIABLES: Input SYS
This is a coding system found in the CODING SYSTEMS file 757.03. It can be in the form of a pointer, a source abbreviation or the name of a coding nomenclature (Required)

VARIABLES: Both .ARY
This is an array of status effective dates and activation status passed by reference (Required)

\[
ARY(0) = \text{Number of Activation History} \\
ARY(<date>,<status>) = \text{Comment}
\]

Status

0  = Inactive
1  = Active

Comments include:

Activated
Inactivated
Re-activated
Revised
Reused

VARIABLES: Output $$HIST
This is the number of activation history entries found

or

-1 ^ error message

COMPONENT: $$PERIOD(CODE,SYS,ARY)
This entry point returns the activation periods (active from and to) of a code in an array passed by reference.

VARIABLES: Input CODE
This is a classification code found in the CODES file 757.02 (Required)

VARIABLES: Input SYS
This is a coding system found in the CODING SYSTEMS file 757.03. It can be in the form of a pointer, a source abbreviation or the name of a coding nomenclature (Required)

VARIABLES: Both .ARY
This is an array of activation periods (including active on date and inactive on date when inactive) passed by reference (Required)

ARY(0) 6 piece "^" delimited string
1 Number of Activation Periods found
2 Coding System (pointer to file 775.03)
3 Coding System Abbreviation
4 Coding System Nomenclature
5 Coding System Full Name
6 Coding System Source

or

-1 ^ Message (no period or error)

ARY(Activation Date) = 4 piece "^" delimited string
1 Inactivation Date (conditional)
2 Pointer to Expression file 757.01 for the code in piece #2 above (required)
3 Variable Pointer IEN;Root of a national file (see below) Include when the code exist in an national file (conditional)

   CPT Procedure code    IEN;ICPT(
   ICD Diagnosis code    IEN;ICD9(
   ICD Procedure code    IEN;ICD0(

4 Short Description from the SDO file (CPT or ICD)

ARY(Activation Date,0) = Lexicon Expression

VARIABLES: Output $$$PERIOD
This is the number of activation periods found:

Same as output variable ARY(0)
or

-1 ^ error message

COMPONENT: $$DX(IEN,VDT)

This entry point is to be used as a screen Lexicon searches. It will screen out all terms not linked to either an ICD-9 or ICD-10 code. The code type (ICD-9 or ICD-10) is determined by date. If the date passed in is before the ICD-10 implementation date then it will screen on ICD-9 codes. If the date is on or after the ICD-10 implementation date then it will screen on ICD-10 codes.

Assuming the variable VDT is a valid Fileman format date:

Screen on ICD Diagnosis

S DIC("S")="I $$DX^LEXU(+Y,VDT)"

VDT is before the ICD-10 implementation date = ICD-9
VDT is on or after the ICD-10 implementation date = ICD-10

If the date is not passed, then TODAY is used.

VARIABLES: Input IEN

This is an internal entry number in the expression file 757.01. When performing Fileman lookups, set it to the variable +Y. (Required)

VARIABLES: Input VDT

This is the versioning date against which the codes found by the search will be compared in order to determine whether the code is active or inactive. Additionally if the date passed is earlier than the ICD-10 implementation date then the screen will only consider ICD-9 codes. If the date is on or after the ICD-10 implementation date then the screen will only consider ICD-10 codes. If the date is not passed, then TODAY's date will be used. (Optional)

VARIABLES: Output $$DX

This is a Boolean value:

$$DX = 1 \ (true) \ if \ the \ Lexicon \ entry \ is \ linked \ to \ an \ active \ ICD \ code \ of \ the \ type \ specified \ by \ the \ input \ parameter \ TYPE.

$$DX = 0 \ (false) \ if \ the \ Lexicon \ entry \ is \ not \ linked \ to \ an \ active \ ICD \ code \ of \ the \ type \ specified \ by \ the \ input \ parameter \ TYPE.

COMPONENT: $$CSDATA(CODE,CSYS,VDT,ARY)

This entry point returns information about a code from a specified coding system. It is intended to be similar to ICDDATA^ICDXCODE except it is not limited to ICD coding systems.
VARIABLES: Input CODE
This is a code found in file 757.02 (CODES file).

VARIABLES: Input CSYS
This is a pointer to the CODING SYSTEMS file 757.03 that identifies the coding system that CODE belongs to. It is important to specify the coding system because some codes overlap various coding systems.

VARIABLES: Input VDT
This is the date that will be used to determine the status of the code in the CODE input parameter. The status will either be Inactive or Active.

VARIABLES: Both .ARY
This is the name of a local array passed by reference that will contain the output.

ARY()

Lexicon Data

ARY("LEX",1) IEN ^ Preferred Term
ARY("LEX",2) Status ^ Effective Date
ARY("LEX",3) IEN ^ Major Concept Term
ARY("LEX",4) IEN ^ Fully Specified Name
ARY("LEX",5) Hierarchy (if it exists)
ARY("LEX",6,0) Synonyms/Other Forms
ARY("LEX",6,1) Synonym #1
ARY("LEX",6,n) #n
ARY("LEX",7,0) Semantic Map
ARY("LEX",7,1,1) Class ^ Type (internal)
ARY("LEX",7,1,2) Class ^ Type (external)
ARY("LEX",7,1,n) #n
ARY("LEX",7,1,n) #n
ARY("LEX",8) Deactivated Concept Flag

Coding System Data

ARY("SYS",1) IEN
ARY("SYS",2) Short Name
ARY("SYS",3) Age High
ARY("SYS",4) Age Low
ARY("SYS",5) Sex
ARY("SYS",6,0) MDC/DRG Pairing
ARY("SYS",6,1,1) MDC
ARY("SYS",6,1,2) DRGs
ARY("SYS",6,n,1) #n
ARY("SYS",6,n,2) #n
ARY("SYS",7) Complication/Comorbidity
ARY("SYS",8) MDC13
ARY("SYS",9) MDC24
ARY("SYS",10) MDC24
ARY("SYS",11) Unacceptable as Principal Dx
ARY("SYS",12) Major O.R. Procedure
ARY("SYS",13) Procedure Category
ARY("SYS",14,0) Description
ARY("SYS",14,1) Text 1
ARY("SYS",14,n) #n

Each data element will be in the following format:

ARY(ID, SUB) = DATA
ARY(ID, SUB, "N") = NAME

Where

ID Identifier, may be:
   "LEX" for Lexicon data
   "SYS" for Coding System data

SUB Numeric Subscript

DATA This may be:
   - A value if it applies and is found
   - Null if it applies but not found
   - N/A if it does not apply

NAME This is the common name given to the data element

Example:

S X=3$CSDATA^LEXU("C18.6",30,3141010,.ARY)
X=1

ARY("LEX",1)=267081^Malignant neoplasm of descending colon" ARY("LEX",1,"N")="IEN ^ Preferred Term" ARY("LEX",2)=1^3131001
ARY("LEX",2,"N")="Status ^ Effective Date"
ARY("LEX",3)=267081^Malignant neoplasm of descending colon" ARY("LEX",3,"N")="IEN ^ Major Concept Term" ARY("LEX",4)="
ARY("LEX",4,"N")="IEN ^ Fully Specified Name"
ARY("LEX",5)="" ARY("LEX",5,"N")="Hierarchy (if exists)" ARY("LEX",6,0)=0
ARY("LEX",6,0,"N")="Synonyms and Other Forms"
ARY("LEX",7,0)=1 ARY("LEX",7,0,"N")="Semantic Map"
ARY("LEX",7,1,1)=6^47"
ARY("LEX",7,1,1,"N")="Semantic Class ^ Semantic Type (internal)"
ARY("LEX",7,1,2)=Diseases/Pathologic Processes^Disease or Syndrome"
ARY("LEX",7,1,2,"N")="Semantic Class ^ Semantic Type (external)" ARY("LEX",8)="
ARY("LEX",8,"N")="Deactivated Concept Flag"
ARY("SYS",1)=501148 ARY("SYS",1,"N")="IEN"
ARY("SYS",2)="Malignant neoplasm of descending colon" ARY("SYS",2,"N")="Short Name"
ARY("SYS",3)="" ARY("SYS",3,"N")="Age High"
ARY("SYS",4)="" ARY("SYS",4,"N")="Age Low"
ARY("SYS",5)="" ARY("SYS",5,"N")="Sex"
ARY("SYS",6,0)=0 ARY("SYS",6,0,"N")="MDC/DRG"
ARY("SYS",7)="" ARY("SYS",7,"N")="Complication/Comorbidity"
ARY("SYS",8)="" ARY("SYS",8,"N")="MDC13"
ARY("SYS",9)="" ARY("SYS",9,"N")="MDC24"
ARY("SYS",10)="" ARY("SYS",10,"N")="MDC24"
ARY("SYS",11)="" ARY("SYS",11,"N")="Unacceptable as Principal Dx" ARY("SYS",12)="N/A"
ARY("SYS",13)="N/A" ARY("SYS",14,0)=1
ARY("SYS",14,0,"N")="Description"
ARY("SYS",14,1)="MALIGNANT NEOPLASM OF DESCENDING COLON"

VARIABLES: Output $$CSDATA
This is a boolean value:

1 if the API is successful (fully or partial)
0 if the API is unsuccessful

-1 ^ Error Message

COMPONENT: $$FREQ(TEXT)
This API checks the frequency of use of keywords contained in a text string in the Lexicon.

VARIABLES: Input TEXT
This is a text string intended as the input for a Lexicon search.

VARIABLES: Output $$FREQ
This is the maximum number of records that must be inspected during a Lexicon search to find matching entries for the input search text.

If this number is too high, applications can prompt the user to either continue with the search or to further refine the search.

COMPONENT: $$MAX(SYS)
This API returns the SEARCH THRESHOLD field #12 of the CODING SYSTEMS file #757.03.

VARIABLES: Input SYS
This is a pointer to the CODING SYSTEM file #757.03.

VARIABLES: Output $$MAX
This is the value stored in the SEARCH THRESHOLD field #12 of the CODING SYSTEMS file 757.03. This
value, along with the value of $$FREQ^LEXU, can be used to evaluate if a search should continue or be further refined.

$$FREQ The maximum number or records to inspect during a search based on the input text string.

$$MAX The maximum number of records to consider for a coding system before refining the search.

COMPONENT: $$CAT(CODE)
This API returns the category (i.e., header) of an ICD Diagnosis code.

VARIABLES: Input CODE
This is a valid ICD Diagnosis code.

VARIABLES: Output $$CAT
This is the category (or header) to which the ICD Diagnosis code belongs.

COMPONENT: $$ISCAT(CODE)
This API determines if an ICD-10 string is an ICD category.

VARIABLES: Input CODE
This is a string used to determine if it is an ICD-10 code or a category.

VARIABLES: Output $$CODE
This is a 4 piece "^" delimited string contains the following:

1 Category flag
   1 CODE is a Category
   0 CODE is not a Category

2 Number of Sub-Categories belonging to the Category

3 Number of Codes belonging to the Category

4 Parent Category
   Parent Category
   Null if no Parent Category

COMPONENT: $$PFI(FRAG,CDT,.ARY)
This API returns a local array containing information about an ICD-10 procedure code fragment.

VARIABLES: Input FRAG
This is a string representing a fragment of an ICD-10 procedure code. An ICD-10 code is 7 characters long and a code fragment is a portion of the code starting at character position #1 and
not to exceed 6 characters in length.

**VARIABLES:** Input  
**CDT**  
This is the versioning date used to select an entry that was appropriate on the date passed. If no date is passed, TODAY is used. Business rules apply, if the date passed is before the implementation date for ICD-10, then the implementation date is used.

**VARIABLES:** Both  
**.ARY**  
This is a local array passed by reference that will contain information about a code fragment.

- **ARY(0)**  
  5 piece "^^" delimited string  
  1 Unique Id  
  2 Code Fragment  
  3 Date Entered  
  4 Source  
  5 Details

- **ARY(1)**  
  4 piece "^^" delimited string  
  1 Effective Date  
  2 Status  
  3 Effective Date External  
  4 Status External

- **ARY(2)**  
  Name/Title

- **ARY(3)**  
  Description

- **ARY(4)**  
  Explanation

- **ARY(5,0)**  
  # of synonyms included

- **ARY(5,n)**  
  Included synonyms

**VARIABLES:** Output  
**$$PFI**  
This is a success flag  
1 on success  
-1 ^ error message on error

**COMPONENT:**  
**$$NXSAB(SAB,REV)**  
This API returns the next Source Abbreviation found in the CODING SYSTEMS file 757.03 using the ASAB cross-reference. It is the equivalent of $O(^LEX(757.03,"ASAB",SAB)).

**VARIABLES:** Input  
**SAB**  
This is either a Source Abbreviation (SAB) from the .01 field of file 757.03 or null value to find the first SAB.

**VARIABLES:** Input  
**REV**  
This is a reverse flag (optional). If set to 1 the API will find the next Source Abbreviation in the reverse order (aka, previous SAB)

**VARIABLES:** Output  
**$$NXSAB**  
This is either the next Source Abbreviation (SAB) previous SAB (when reverse flag set to 1) or null
if the input parameter SAB has no next SAB.

COMPONENT: $$RECENT(SAB)
This API returns a boolean valued flag to indicate if the coding system identified by the source abbreviation has been recently updated with in a 90 day window (looking forward by 30 days and to the past by 60 days). This is to evaluate if a coding system was updated by a quarterly patch, and may be used to trigger an code set update protocol.

VARIABLES: Input SAB
This is either a 3 character source abbreviation taken from the .01 field of the CODING SYSTEM file 757.03 or a pointer to the CODING SYSTEM file 757.03.

VARIABLES: Output $$RECENT
This is a Boolean valued flag.

1 indicates the Coding System has been recently updated by a quarterly update by looking 30 days into the future and 60 days for a change made to the coding system.

0 indicate the Coding System has NOT been recently updated by a quarterly update.

COMPONENT: $$RUPD(SAB)
This API returns a date the coding system identified by the source abbreviation has been updated based on a recent date (TODAY+3). This is to evaluate if a coding system was updated by a quarterly patch, and may be used to trigger an code set update protocol.

VARIABLES: Input SAB
This is either a 3 character source abbreviation taken from the .01 field of the CODING SYSTEM file 757.03 or a pointer to the CODING SYSTEM file 757.03.

VARIABLES: Output $$RUPD
This is date found for the last update to a coding system based on a recent date (TODAY+30)

COMPONENT: $$LUPD(SAB,DATE)
This API returns the last date the coding system identified by the source abbreviation has been updated based on the date supplied (optional). If no date is supplied, the last date will be returned.

VARIABLES: Input SAB
This is either a 3 character source abbreviation taken from the .01 field of the CODING SYSTEM file 757.03 or a pointer to the CODING SYSTEM file 757.03.
VARIABLES:  Input     DATE
This is a date to use to retrieve the last update
for a coding system (optional)

VARIABLES:  Output     $$LUPD
This is date found for the last update to a coding
system based on a recent passed or the last date
updated if a date is not passed.

COMPONENT:  $$PAR(TXT,.ARY)
This API takes a string of text and parses the string into
words using the parsing logic used by the Lexicon search
engine.

VARIABLES:  Input     TXT
This is a text string intended as the input for a
Lexicon search and will be parsed into words and
placed in a local array (Required)

VARIABLES:  Input     .ARY
Local array, passed by reference

VARIABLES:  Output     $$PAR
This is the number of words parsed from the text

VARIABLES:  Output     ARY
This is a local array containing the words parsed
from the input text. The words are arranged in
the order they are found in the text; in
alphabetical order; and in the order they are used
in the Lexicon search (frequency order)

Total words found

    ARY(0)=#

Words listed in the order they appear in the input
variable TXT

    ARY(1)=WORD1
    ARY(n)=WORDn

Words listed alphabetically with the frequency of
occurrence in the Lexicon

    ARY("B",WORDA)=# (Frequency of Use)
    ARY("B",WORDB)=#

Words listed in the frequency order. This is the
order the words will be used by the Lexicon search
engine, starting with the least frequently used
word and ending with the most frequently used
word.

    ARY("L",1)=SEARCHWORD1
    ARY("L",n)=SEARCHWORDn
COMPONENT:  $$SCT(IEN,DATE)
This entry point is a screen used during searches to return terms with SNOMED CT codes that are not classified as Veterinary.

VARIABLES:  Input    IEN
Internal Entry Number in the Expression file ^LEX(757.01).

VARIABLES:  Input    DATE
This is a date in Fileman format used to check if a code is active or inactive on a specified date. If not supplied, it will default to TODAY.

VARIABLES:  Output    $$SCT
This is a Boolean value:

$$SCT = 1 (true) if the Lexicon entry is
Linked to an active SNOMED CT code and the term is not a Veterinary term

$$SCT = 0 (false) if the Lexicon entry is
Not linked to an SNOMED CT code or the SNOMED CT code is inactive or the term is a Veterinary term

Excludes terms semantically typed as a Veterinary term.

VARIABLES:  CODE      Type: Input
            Code taken from the Codes file 757.02. (Required)

            SAB      Type: Input
            Source, this is an internal entry number in file 757.03 or the 3 character source mnemonic (found on the ASAB cross-reference in file 757.03) or the
SOURCE ABBREVIATION (.01 field in file 757.03) It is used to distinguish between different coding systems with the same code (i.e., the code 300.01 occurs in both the ICD-9 CM and DSM IV coding systems). (Required)

DATE Type: Input

This is a date in Fileman format used to check if a code is active or inactive on a specified date. If not supplied, it will default to TODAY.

$$EXP Type: Output

This is a 2 Piece "^" delimited string containing

Either:

1  Pointer to Expression file #757.01
2  Display Text (Expression)

or:

1  -1
2  Error Message

This entry point allows an application to retrieve an active preferred term for a coding system on the date provided.

5681  Lexicon ICD-10 APIs - LEX10CS

CUSTODIAL PACKAGE: LEXICON UTILITY

SUBSCRIBING PACKAGE:

USAGE: Supported ENTERED: JUN 6,2011
STATUS: Pending EXPIRES:
DURATION: Till Otherwise Agr VERSION:
DESCRIPTION: Type: Routine

Supported APIs for the implementation of ICD-10. The APIs in this ICR become effective on the date of release of patches ICD*18.0*57 and LEX*2.0*80.

ROUTINE: LEX10CS

COMPONENT: $$ICDSRCH(TEXT,.ARRAY,DATE,LEN,FILTER)

This entry point searches for an ICD code and returns active ICD codes found up to the number defined by the input parameter Length. If the date is before the ICD-10 implementation date the search will be conducted for ICD-9 codes. If the date passed is on or after the ICD-10 implementation date the search will be conducted for ICD-10 codes.

VARIABLES: Input TEXT

Text or Code to search for. (Required)
VARIABLES: Input .ARRAY
This is a local output array passed by reference.
(Required)

VARIABLES: Input DATE
The date against which the codes found by the
search will be compared in order to determine
whether the code is active or inactive. If not
passed, TODAY's date will be used. (Optional, but
when used must be in FileMan format)

VARIABLES: Input LEN
This specifies the length of the list of codes.
Default value is 30. (Optional)

VARIABLES: Input FILTER
This is a filter to apply to the search to screen
out unwanted entries. It is MUMPS code in the
form of a valid IF statement. It is the same as
Fileman's DIC("S"). (Optional)

VARIABLES: Output $$ICDSRCH
2 Piece "^" delimited string the success/error
conditions
A Positive number for successful search not
exceeding the Length of the list.
A Negative number for an unsuccessful search or a
search condition

-1^No codes found

No codes found and local array not returned

-2^Too many items found, please refine search

The list exceeds the number indicated by
LEN,
however, the first LEN of the Array is
returned and the list is marked as a pruned
list

VARIABLES: Output ARRAY
Output Array passed by reference containing the
codes found

ARRAY(0)=# found ^ Pruning Indicator
ARRAY(1)=CODE ^status effective date
ARRAY(1,"IDL")=ICD Dx long description (if
code)

ARRAY(1,"IDL,1")=ICD Dx IEN ^ effective date
ARRAY(1,"IDS")=ICD Dx short description (if
code)

ARRAY(1,"IDS,1")=ICD Dx IEN ^ effective date
ARRAY(1,"LEX")=Lexicon expression
COMPONENT:  $$DIAGSRCH(TEXT,.ARRAY,DATE,LEN,FILTER)
This entry point searches for an ICD code and returns active ICD-10 codes found up to the number defined by the input parameter Length. This search is similar to $$ICDSRCH^LEX10CS except it only searches ICD-10 codes.

VARIABLES:  Input  TEXT
            Text or Code to search for.  (Required)

VARIABLES:  Input  .ARRAY
            This is a local output array passed by reference.  (Required)

VARIABLES:  Input  DATE
            The date against which the codes found by the search will be compared in order to determine whether the code is active or inactive. (Optional, but when used must be in FileMan format)

VARIABLES:  Input  LEN
            This specifies the length of the list of codes.  Default value is 30.  (Optional)

VARIABLES:  Input  FILTER
            This is a filter to apply to the search to screen out unwanted entries.  It is MUMPS code in the form of a valid IF statement.  It is the same as Fileman's DIC("S").  (Optional)

VARIABLES:  Output  $$DIAGSRCH
            2 Piece "^" delimited string the success/error conditions
            A Positive number for successful search not exceeding the Length of the list.
            A Negative number for an unsuccessful search or a search condition
            -1^No codes found
                No codes found and local array not returned
            -2^Too many items found, please refine search
                The list exceeds the number indicated by LEN,
                however, the first LEN of the Array is
list

VARIABLES: Output ARRAY
Output Array passed by reference containing the ICD-10 codes found

ARRAY(0)=# found ^ Pruning Indicator
ARRAY(1)=CODE or Category ^ status effective date (code only)
ARRAY(1,"CAT")=Category Name
ARRAY(1,"IDL")=ICD Dx long description (if code)
ARRAY(1,"IDL",1)=ICD Dx IEN ^ effective date
ARRAY(1,"IDS")=ICD Dx short description (if code)
ARRAY(1,"IDS",1)=ICD Dx IEN ^ effective date
ARRAY(1,"LEX")=Lexicon expression
ARRAY(1,"LEX",1)=Lexicon IEN ^ effective date
ARRAY(1,"SYN",1)=synonym #1
ARRAY(1,"SYN",m)=Synonym #m
ARRAY(1,"MENU")=Menu Text
ARRAY(1,"MSG")=Message (unversioned only)

Notes:

Pruning Indicator: If the second piece of ARRAY(0) is greater than 0, then the list has been pruned, limiting the list to the length specified by the input parameter LEN.

If there is a message, it can be either:

Inactive mm/dd/yyyy
Pending mm/dd/yyyy

COMPONENT: $$PCSDIG(FRAG,DATE)
This entry point takes an ICD-10-PCS code, full or a partial (code fragment), and returns a list of all possibilities for the next character, with any definitions and examples available. If a full code is passed (7 characters) it will return the code's long description, and status.

VARIABLES: Input FRAG
This is an ICD-10-PCS Code (7 characters) or a fragment of an ICD-10-PCS Code (less that 7 characters) (Required)

VARIABLES: Input DATE
The date against which the codes found by the search will be compared in order to determine whether the code is active or inactive. (Optional, defaults to TODAY)

VARIABLES: Output LEXPCDAT
This is both a variable and an array. If the
length of the FRAG is less than 7, then the array will contain the next level of choices and associated data. If the length of the FRAG is equal to 7, then a fully specified code has been passed and the array will contain the long description, status and effective date of the code.

If the string FRAG is a valid code fragment or null, the return value of LEXPCDAT will be 1 and the following array will be returned.

```
LEXPCDAT("NEXLEV ,char1, DESC )=char1
description
LEXPCDAT("NEXLEV ,char2, DESC )=char2
description
LEXPCDAT("NEXLEV ,charn, DESC )=charn
description
```

If the string FRAG is a valid code the return value of LEXPCDAT will be 1 and the following array will be returned.

```
LEXPCDAT("PCSDESC )=long description for code
LEXPCDAT("STATUS )=status_ ^ _effective date
```

If the string FRAG is a not valid code fragment or null and it is not a valid code, the return value of LEXPCDAT will be 0 and no array will be returned.

```
COMPONENT:  $$CODELIST(SYS,SPEC,SUB,DATE,LEN,FMT)
This entry point creates a list of active codes based on an input code mask and date and places the list in a temporary global array with a subscript specified by the calling application.

VARIABLES:  Input     SYS
Coding system the Coding Systems file 757.03. This can be a pointer, the .01 field or the abbreviated 3 character mnemonic (found on the ASAB cross-reference (Required)

VARIABLES:  Input     SPEC
This is a code from the coding system or a code mask. Any character position can be occupied by a question mark "?" to allow any value in that character position. The trailing character may be an asterisk indicating any characters that follow are allowable. The following are all valid; C71.0, C71.*, C7?.0 or 02V?0* (Required)

VARIABLES:  Input     SUB
This is a string, preferably in the calling applications namespace, that will be used as a subscript in a temporary global array (optional, if not passed CODELIST will be used as a
The date against which the codes found by the search will be compared in order to determine whether the code is active or inactive. (Optional, but when used, must be in FileMan format)

This specifies the length of the list of codes. Default value is 30. (Optional)

List Format (Optional)

0 - (zero) returns a brief listing in the global array (codes only) (DEFAULT)

1 - returns a detailed listing in the global array, includes the code, a variable pointer the code in a code set file (i.e., ICD-9, CPT, etc), the code's effective date, the expression and the expression IEN from file #757.01.

2 Piece "^" delimited string containing
Either:

Piece Meaning
1 Positive value for success
2 Number of Codes Found

or:

Piece Meaning
1 Negative number for error or condition
2 Error Message or Condition

Example errors/conditions

-1 Coding system not specified (First parameter is missing)
-2 Invalid coding system/source abbreviation (First parameter not valid)
-3 No search specification (Second parameter missing)
-4 Insufficient search specification" (Second parameter too short)
-5 Invalid search specification (Second parameter invalid)
-6 Number of matches exceeds specified limit (More matches found, only the
VARIABLES: Output

This is a global array subscripted as specified by the calling application, input parameter SUB. It contains a list of codes found in either a brief or detailed output.

Brief output array (FMT = 0)

^TMP(SUB,$J,0)=Total n
^TMP(SUB,$J,1)=Code 1
^TMP(SUB,$J,2)=Code 2
^TMP(SUB,$J,n)=Code n

Detailed output array (FMT = 1)

^TMP(SUB,$J,0)=Total n
^TMP(SUB,$J,1)=Code 1
^TMP(SUB,$J,1,1)=Variable Pointer 1 ^ Code 1 ^ date
^TMP(SUB,$J,1,2)=Term 1 IEN ^ Term 1
^TMP(SUB,$J,1,"MSG")=Message (unversioned only)
^TMP(SUB,$J,2)=Code 2
^TMP(SUB,$J,2,1)=Variable Pointer 2 ^ Code 2 ^ date
^TMP(SUB,$J,2,2)=Term 2 IEN ^ Term 2
^TMP(SUB,$J,2,"MSG")=Message (unversioned only)
^TMP(SUB,$J,n)=Code n
^TMP(SUB,$J,n,1)=Variable Pointer n ^ Code n ^ date
^TMP(SUB,$J,n,2)=Term n IEN ^ Term n
^TMP(SUB,$J,n,"MSG")=Message (unversioned only)

Notes:

If the code is found in one of the VistA Code Set files controlled by a Standards Development Organization (SDO) then a variable pointer will be provided for that code in that file. Example of SDO controlled files include:

ICD DIAGNOSIS file #80
ICD OPERATION/PROCEDURE file #80.1
CPT file #81
DSM file #627.7

If there is a message, it can be either:

Inactive mm/dd/yyyy
Pending mm/dd/yyyy

COMPONENT: $TAX(TEXT,SRC,CDT,SUB,VER)
This API returns codes that qualify for building a taxonomy.
Originally designed for ICD-10, but modified to include any coding system (DSM, ICD, SNOMED CT, CPT, etc.)

VARIABLES: Input

TEXT
This is the text or code to search for.

VARIABLES: Input

SRC
This is a string of coding systems delimited by an "^" up arrow to limit the search to the desired coding systems. The string can consist of pointers to the CODING SYSTEM file 757.03 or source abbreviations.

Using source abbreviations
"ICD^ICP^10D^10P"

Using source pointers to file 757.03
"1^2^30^31"

VARIABLES: Input

CDT
This a date used processing versioned data. Also, when a versioned list is required (input parameter VER=1) it is used to suppress inactive codes from the list.

VARIABLES: Input

SUB
This is the name of a subscript to use in the ^TMP global (optional). This allows for applications to put the data in their own namespace. It also allows for multiple search results to exist.

^TMP(LEXSUB,$J,
^TMP("LEXTAX",$J, Default

VARIABLES: Input

VER
This is a boolean flag that indicates if the search is to be versioned. If set to 1, only active codes will be returned based on the date in the CDT input parameter. If no date, then TODAY is used.

VER = 0  Return active and inactive codes
VER = 1  Version, return active codes only

VARIABLES: Output

$$TAX
This the number of codes found by the search or -1 with an error message.

VARIABLES: Output

TMP(SUB,$J)
This is the results of the search saved in the ^TMP global with the specified subscript:

^TMP(SUB,$J,SRC,(CODE=" "),#)
5 piece "^" delimited string
1 Activation Date (can be a future date)
2 Inactivation Date (can be a future date)
3 Lexicon IEN to Expression File 757.01
4 Variable Pointer to a National file
5 Short Name from a National file

^TMP(SUB,$J,SRC,(CODE_" "),#,0)

2 piece "^" delimited string

1 Code (no spaces)
2 Lexicon Expression

Example:

Search for "DIFFICULTY IN WALKING" For sources "ICD^10D" (ICD-9/10 Diagnosis)

^TMP("TAX",$J,0)=3 ^TMP("TAX",$J,1,"719.7 ",1)=
2781001^2791001^329945^4611;ICD9(^DIFFICULTY IN WALKING
^TMP("TAX",$J,1,"719.7 ",1,0)=
719.7^Difficulty in Walking
^TMP("TAX",$J,1,"719.7 ",2)=
3031001^3131001^329945^4611;ICD9(^DIFFICULTY IN WALKING
^TMP("TAX",$J,1,"719.7 ",2,0)=
719.7^Difficulty in Walking
^TMP("TAX",$J,1,"781.2 ",1)=
2781001^3131001^48820^5419;ICD9(^ABNORMALITY OF GAIT
^TMP("TAX",$J,1,"781.2 ",1,0)=
781.2^Abnormality of Gait
^TMP("TAX",$J,30,"R26.2 ",1)=
3131001^5019306^521502;ICD9(^Difficulty in walking, not
elsewhere classified
^TMP("TAX",$J,30,"R26.2 ",1,0)=
R26.2^Difficulty in Walking, not
elsewhere classified

5781 Mixed Case - LEXXM

5781 NAME: Mixed Case
CUSTODIAL PACKAGE: LEXICON UTILITY
SUBSCRIBING PACKAGE: DRG GROUPER

This API is used by the special lookup ICDEXLK* to
display entries to the user for selection.

USAGE: Controlled Subscri ENTERED: MAR 8,2012
STATUS: Pending EXPIRES:
DURATION: Till Otherwise Agr VERSION:
DESCRIPTION: TYPE: Routine

ROUTINE: LEXXM
COMPONENT: $$MIX(TEXT)

This API converts text from any form to a modified mix text
format. Example:

Input:

arthropathy in behcet's syndrome involving other specified sites

Traditional Mixed Case (FileMan):

Arthropathy in Behcet's Syndrome Involving Other Specified Sites

Lexicon Mixed Case ($$MIX^LEXXM):

Arthropathy in Behcet's Syndrome involving other specified sites

VARIABLES: Input TEXT
This is a text string to be converted to mix text.

VARIABLES: Output $$MIX
This is a string of text in mixed case.

5840 Lexicon ICD-10 Suggestions - LEX10CX

5840 NAME: ICD-10 Suggestions
CUSTODIAL PACKAGE: LEXICON UTILITY
SUBSCRIBING PACKAGE: ORDER ENTRY/RESULTS REPORTING AUTOMATED INFO COLLECTION SYS PROBLEM LIST
USAGE: Controlled Subscri ENTERED: SEP 6, 2012
STATUS: Pending EXPIRES:
DURATION: Till Otherwise Agr VERSION:
DESCRIPTION: TYPE: Routine

ROUTINE: LEX10CX
COMPONENT: EN
This entry point is an interactive lookup where the input coding system and code are not known. There is no input variables for this API, however, the variable LEXSAB can be preset to a coding system (.01 field in file 757.03), else wise the user will be prompted for a coding system. This API will display a selection list of suggested ICD-10 codes that have a similar textual content as the user selected code and coding system. If no suggestions are available or the user does not make a selection, then the user will be prompted for a ICD-10 code. There are two output variables, X and Y.

Example Output:

ICD-9 to ICD-10

X="119899^Tobacco Use Disorder^305.1^ICD-9-CM"
Y="5003360^Nicotine Dependence, unspecified, Uncomplicated^F17.200^ICD-10-CM"
SNOMED CT to ICD-10

X="7078519^Diabetes mellitus type 2^44054006^SNOMED CT"
Y="5002666^Type 2 Diabetes Mellitus without Complications^E11.9^ICD-10-CM"

VARIABLES: Output X

X is a 4 piece "^" delimited string representing the source code.

1 Lexicon IEN for file 757.02
2 Expression
3 Code in selected Coding System
4 Coding System nomenclature

or null if search fails

VARIABLES: Output Y

Y is a 4 piece "^" delimited string representing the target ICD-10 code.

1 Lexicon IEN for file 757.02
2 Expression
3 ICD-10 Diagnostic Code
4 ICD-10-CM

or -1 if search fails

VARIABLES: EN2

COMPONENT: EN2(CODE,SAB)

This entry point is an interactive lookup where the input coding system and code are known and supplied as input parameters CODE and SAB. This API will display a selection list of suggested ICD-10 codes that have a similar textual content as the specified code (CODE) and coding system (SAB). If no suggestions are available or the user does not make a selection, then the user will be prompted for an ICD-10 code. The output for EN2 is the same as entry point EN.

VARIABLES: Input CODE

This is a code from the specified coding system.

VARIABLES: Input SAB

This is the coding system abbreviation (a three character representation of the coding system taken from the .01 field of the CODING SYSTEMS file 757.03)

VARIABLES: Output X

X is a 4 piece "^" delimited string representing the source code.

1 Lexicon IEN for file 757.02
2 Expression
3 Code in selected Coding System
4 Coding System nomenclature
or null if search fails

VARIABLES: Output Y

Y is a 4 piece "^" delimited string representing
the target ICD-10 code.

1 Lexicon IEN for file 757.02
2 Expression
3 ICD-10 Diagnostic Code
4 ICD-10-CM

or -1 if search fails

COMPONENT: EN3(CODE,SAB,.ARY,MAX)

This entry point is a silent lookup for suggested ICD-10 codes
for a code in another coding system. The code (CODE) and
coding system abbreviation (SAB) are passed as input
parameters.

This API will create an array of suggested ICD-10 codes that
have a similar textual content as the specified code (CODE)
and coding system (SAB).

VARIABLES: Input CODE

This is a code in the coding system identified by
the input parameter SAB.

VARIABLES: Input SAB

This is the coding system abbreviation (a three
character representation of the coding system
taken from the .01 field of the CODING SYSTEMS
file 757.03)

VARIABLES: Both ARY

This is a local array, passed by reference:

ARY("X") Input
ARY("Y",0) Output Number of Suggestions
ARY("Y",1) Output First Suggestion
ARY("Y",n) Output nth Suggestion
ARY("E") Error Message

Both ARY("X") and ARY("Y",#) are 4 piece "^"
delimited strings:

1 Internal Entry Number (IEN) file 757.01
2 Expression (file 757.01, field .01)
3 Code (file 757.02, field 1)
4 Nomenclature (file 757.03, field 1)
i.e., SNOMED CT, ICD-9-CM or ICD-10-CM

VARIABLES: Input MAX

This is the maximum number of suggestions to
return in the array (optional, default 100)

KEYWORDS: ICD-10
