Introduction

This document is for users working with the CAPRI DBQ Push Utility, which was created to distribute CAPRI templates out to VISNs/sites. This tool is a mechanism for distributing new/updated template definitions to a site’s template definition file. This utility (tool) pushes those template definitions (like Disability Benefits Questionnaires - DBQs) into a site’s template definitions file, CAPRI TEMPLATE DEFINITIONS file (#396.18).

This document contains screen shots of the user interface to assist current and future personnel in support of this Class 3 to Class 1 tool. When the CAPRI DBQ Push Utility becomes a Class 1 product, this tool will have a very limited number of technical users--comprised entirely of developers.
User Instructions

With the CAPRI DBQ Push Utility, a user can use as many of the tabs as is necessary to accomplish a request for a template push, pull, and/or edit. In most circumstances, the user will use only the Export (Push) tab.

Access the Utility

1. Log in through the Broker.

Cache Telnet window>Access Code and Verify Code
Structure of the CAPRI TEMPLATE DEFINITIONS file

Cache Telnet window>CAPRI TEMPLATE DEFINITIONS file

Structure of the CAPRI SITE LIST file

Cache Telnet window>CAPRI SITE LIST file
Export (Push) Tab

The user must have intimate knowledge about what occurred and how to push templates. Pushes should not be made unconsciously.

About Template Selection

- At selection, you may/may not know if the template or a previous version of the template exists at the site.
- A template of the same name can be selected only once if multiple versions of it exist. This ensures that only one template of a given name is enabled and activated at a time. If multiple versions need to be uploaded, the user is required to make multiple pushes to the site.
- When an existing active template on the remote site with the same name as the template being uploaded is found, it will automatically be de-activated by:
  a. Setting its DE-ACTIVATION DATE field (#3) to today’s date and
  b. Setting its SELECTABLE BY USER field (#7) to No.
- You can overwrite selected templates at the remote site.
  a. When the template (name and version match) exists at the remote site, the existing template information is overwritten.
  b. If a name and version match cannot be found, the template is added as a new template.

  **Caution:** Problems with existing exams at a site can occur if structural changes were previously made to the template. Use this only for wording changes within the template.

- You can disable selected templates at the remote site.
  a. When the template (name and version match) exists at the remote site, the existing template is de-activated by:
    i. Setting the DE-ACTIVATION DATE field (#3) to today’s date.
    ii. Setting the SELECTABLE BY USER field (#7) to No.
  b. If a name and version match cannot be found, the template is ignored.
2. Authenticate with your Access and Verify Codes through the CLAIMS system (or TESTCLAIMS). The CAPRI Template Remote Transfer Utility window displays with the list of available sites and the Export tab active.

![CAPRI Template Remote Transfer Utility window>Export (Push) tab open](image)

3. Select the site(s) to be modified from the list retrieved from the CLAIMS or TESTCLAIMS system. One or more, or all sites can be selected.

4. Click Add.
   The Template Selection window displays.

   **Note:** Use Template Selection for regular, overwrite, or disable only pushes. At least one template must be in the list to proceed with the updates for the site(s).
5. Select templates from the Gold Template List (Gold Copy currently retrieved from the DEVFEX account) to push to the selected sites.

6. Click Ok.
   The selected templates are added to the list box on the form. Select templates from the configured development account list to add.

   **Note:** Push Update remains deactivated until:
   
   1. User selects at least one site and
   2. User adds at least one template to the list.

7. Click Push Update to proceed.
   The action is confirmed.
Sites selected>Export (Push) tab>Clear Selected Sites pop-up

8. Click **Yes**.

The template(s) of the site(s) are updated.

**Note:** The use of the **Overwrite at Site(s)** and **Disable Only** check boxes varies depending on how the Push is processed. Overwrite and disable selections are mutually exclusive.
9. Optional: Select **Overwrite at Site(s)** the check box. Warning pop-up displays. The user is warned that if care is not taken when executing the overwrite behavior, synchronization problems can occur.

**Note:** Use of the overwrite behavior is a decision made by the person executing the push, provided it is the same individual who is creating the template. Otherwise, consulting with that individual is paramount to determining what action needs to be performed.

![Screenshot of CAPRI Template Remote Transfer Utility](image)

Export (Push) tab>Overwrite at Site(s) selected>Warning pop-up

10. Click **OK**. The Overwrite at Site(s) action finishes.

The automatic process of de-activating templates only works for same name entries. Use Disable Only, when a template:
- is taken down and no longer is in use or
- was renamed. (Two pushes are required when a template is renamed.)
The user must be aware of what is occurring:

- to de-activate the old and
- to push out the new template.

11. Optional: Select the **Disable Only** check box.

![Export (Push) tab>Disable Only selected](image)

12. Click **OK**. The Disable Only action finishes.
Optional/Change the Master Template Account

The Master Template Account is automatically configured at install to default to the DEVFEX account, and would only require updating if the location changed.

To change the master template account:
1. Click **Change**.
   The Change Master Template Account pop-up displays.
2. Verify Name, Address, and Port.
3. Enter Name, Address, and Port.

Export (Push) tab>Change Master Template Account pop-up
4. **Click Save.**
If successful, nothing displays to the user.

   **Note:** An XML file is created at the root level of the application.
   - If changed, the application tries to connect to the new site.
   - If connection cannot be made, a message displays informing the user that the remote site connection could not be made.
   - Because the master template account is used as the filter/comparison against the site’s data (Pull/Edit Local) and it is where templates are retrieved for the export, the tool is useless until that connection is made.

5. **Click Ok.**
The selected templates display in the Template(s) list box.

![Export (Push) tab with templates added to the Template(s) list box](image)

Export (Push) tab with templates added to the Template(s) list box
6. Click **Push Update**. The action is confirmed.

   **Note:** **Push Update** remains de-activated until:
   1. User selects at least one site and
   2. User adds at least one template to the list.

   Sites selected>Export (Push) tab>Confirm pop-up
7. **Click Yes.**
   The Update Results window displays with a report detailing the processing that occurred at each of
   the selected remote sites.

![Export (Push) tab>Update Results window]
8. To close Template Update Report Results, click X in the upper right corner of the window. The Save Template Report Results pop-up displays.

9. Select a location in which to Save the file.
10. Add a File name and select a Save as type.
11. Click Save.
   The report file is saved to the selected location.
Import (Pull) Tab

The user must have intimate knowledge about what occurred and how to pull templates. Pulls should not be made unconsciously.

About Template Selection

- Templates from the Gold Account are retrieved and stored in a list for comparison.
- Templates are retrieved from the remote site and compared against the list from the Gold Account.
  a. If a match is found with the same template name (1st piece of .01 field) and version (2nd piece of .01 field), the template is ignored because it already exists at the site.
  b. If match is not found on either name and/or version, the template is added to:
     • The Production Template List (new or updated versions) when the version does not contain a T (indicates a Test Template).
     • The Test Template List when the version contains a T.
- A template of the same name can be selected only once if multiple versions of it exist. This ensures that only one template of a given name is enabled and activated at a time. If multiple versions need to be uploaded, the user is required to make multiple pulls into the site. This applies to both the production and test template lists.
- When an existing active template on the remote site with the same name as the template being uploaded is found, it will automatically be de-activated by:
  a. Setting its DE-ACTIVATION DATE field (#3) to today’s date and
  b. Setting its SELECTABLE BY USER field (#7) to No.
1. Authenticate with your Access and Verify Codes through the CLAIMS system (or TESTCLAIMS). The CAPRI Template Remote Transfer Utility window displays with the list of available sites.

2. Select the Import (Pull) tab. Text boxes for Production Templates and Test Templates displays.

3. Select the site to be modified from the list retrieved from the CLAIMS or TESTCLAIMS system. Only a single site can be selected and worked on at any given time.

   **Note:** The warning is a static display for informational purposes only.

   **Warning! A test site agreement is required before importing these templates.**
Production Templates and Test Templates

- If a site is selected, select the template(s) from either the Production Templates list or Test Templates list, if any exist, to be pulled into the site.

- If no site is selected, the lists are empty. A site must be selected for these lists to be populated.

- If the template(s) exist in either list, the template and/or that version does not exist at the site, the template can be selected to pull in.

- After site selection, the templates may still be blank if each entry exists in the site’s Gold Account.
4. Click **Import Selected**.
The Update Results window displays with a report detailing the action taken on each of the selected remote site(s) and selected template(s).

**Note:** For either the Production Templates or Test Templates, at least one template must be selected to activate the respective **Import Selected** button.

5. To close Template Update Report Results, click **X** in the upper right corner of the window. The Save Template Report Results pop-up displays.
6. Select a location in which to **Save** the file.
7. Add a **File name** and select a **Save as type**.
8. Click **Save**.
The report file is saved to the selected location.
Edit Local Tab

The user will use the Edit Local tab very infrequently, if at all. It is a means for manipulating the template fields, if needed.

The user must have intimate knowledge about what occurred and how to edit templates. Changes should not be made unconsciously.

About Template Selection

- All templates from the remote site are added to the Local Template list for selection.
- All fields can be edited with the exception of the FORM DEFINITION field (#4) in the CAPRI TEMPLATE DEFINITIONS file (#396.18), which is in a binary format.
- The only checks imposed by the application are Data Dictionary checks, executed by an FMValidator component, to ensure that the information entered can be filed.

  **Note:** You are responsible to ensure changes are valid, and that no conflicts exist among current templates.

1. Authenticate with your Access and Verify Codes through the CLAIMS system (or TESTCLAIMS). The CAPRI Template Remote Transfer Utility window displays with the list of available sites.
2. Select the **Edit Local** tab.

CAPRI Template Remote Transfer Utility window> Edit Local tab

3. Select the site to be modified from a list retrieved from the CLAIMS or TESTCLAIMS system.
   - Only a single site can be selected and worked on at a given time.
   - Only a single template can be edited at a given time.

4. Select a template in the Local Templates list.
   Template information is retrieved and below the Local Templates list, the ten components are populated for editing.
   - If a value exists in the file, each field is auto-populated.
   - If no value exists, the field is blank.
5. Edit the necessary fields: Name, Activation Date, De-Activation Date, Last Update, Selectable By User, Object Count, Released, Script Style, CRC, and Description.

Example
If a template is accidently disabled, the user can re-activate the template by:
- Deleting the de-activation date and
- Setting the Selectable By User to Yes.

6. Click Save Changes.
Immediately, the changes are written directly to the file and no report is generated.

Note: The Edit Local tab will not be used often. The user should understand the effect changes will have prior to making any changes.
Troubleshooting

- If Sanctuary or other port blocking software is installed on your machine, the application will only be able to connect to sites with their connection port configured at the VMS level.
- If started locally, the application will terminate because of the call back functionality of the Broker software.
- If JAWS is used with the application, ensure that the VA508Runtime scripts are installed on the machine http://vaww.vista.med.va.gov/508workgroup/Delphi/download.asp

Additional Information

Example of a CAPRI Template

Example of a CAPRI template

Configuration Information

The use of the CAPRI DBQ tool does not require configuration.

The use of the tool is specific in nature and is hardcoded in the CLAIMS system for authentication/verification (Production).

- When you define T=1 in the Target directory of the application shortcut, the tool defaults to the TESTCLAIMS (Test) system.
- To use the CAPRI DBQ tool, you must have the option DVBA MANAGE CAPRI TEMPLTES GUI assigned to you on the CLAIMS or TESTCLAIMS system.
- VA508Runtime scripts must be installed prior to launching the application, if it will be used with screen readers (i.e., JAWS).
  
Developer Workstation Requirements

- Delphi 2006 Integrated Development Environment (IDE)
- Installation of the Standard Broker Component for Delphi 2006
  http://vista.med.va.gov/broker/download.asp#programmer
- Installation of the FileMan (FM) Delphi Component for Delphi 2006
  Refer to the VistA Document Library (VDL) under Infrastructure for information
  http://www.va.gov/vdl/
- Installation of the VA 508 Framework
- Import of the Type Library: Microsoft XML, v6.0 (Version 6.0)

Site Connections

- The Connection is hardcoded to the CLAIMS Server (FORUM.VA.GOV – 9400) for Authentication/Verification.
- If parameter T=1 is defined in the target path, the connection is hardcoded to the TESTCLAIMS Server (10.2.29.141 – 9400) for Authentication/Verification.
- To use this utility, you must be assigned the option **DVBA MANAGE CAPRI TMPLTES GUI**. This option is created only on the CLAIMS and TEST CLAIMS systems, because this is where you are authenticated and where the initial context is created.
- The option **DVBA CAPRI GUI** is used to create the context for connection to remote sites. (This is already distributed and in use nationally by CAPRI.)
- The Remote Site list is retrieved from the CAPRI SITE LIST file (#396.97). This file exists only in the CLAIMS and TESTCLAIMS systems and is used extensively by CAPRI. (This is not distributed nationally.)
- Define a specific site to connect to by specifying the site’s address and port. (This precludes the selection from the Site list.)
- When pushing templates to sites, you can select multiple sites.
- When pulling or editing templates, you can select only a single site.
- If the **All Production Sites** checkbox is selected, the non-production accounts (those beginning with @) will not be updated. (This applies only to Push, as it involves multiple-site selection.)
Gold Templates

- The initial Gold Template location is hardcoded to the VistA system, DEVFEX (cor.isc-albany.med.va.gov), in Albany.
- The Gold Template location can be changed using button execution within the GUI. This generates an XML file that persists the Name, Address and Port information. When the XML file already exists, the file is either created or overwritten and stored at the root path of the application.
- The XML file will not exist on the initial run of the application, but will exist in subsequent iterations, once it is dynamically created. (Noted by the GUI caption, Internally Hardcoded)
- If the XML file is corrupt (or missing information), the GUI reverts back to the hardcoded location of DEVFEX, thereby creating/overwriting the XML file.
- Gold Templates are retrieved from the specified location in the CAPRI TEMPLATE DEFINITIONS File (#396.18).
