Primary Care & Tobacco Cessation Handbook

A Resource for Providers
This page intentionally left blank.
Acknowledgements

The provider manual *Primary Care & Tobacco Cessation* and the accompanying *My Tobacco Cessation Workbook* were developed by Julianne Himstreet, Pharm.D., BCPS. The author’s primary goal was to develop materials promoting tobacco cessation interventions, based on published principles of evidence- and consensus-based clinical practice, for use by primary care providers treating patients who use tobacco.

With permission from the HIV and Smoking Cessation (HASC) Working Group, several materials used in the *Primary Care & Tobacco Cessation* provider manual were modified from *HIV Provider Smoking Cessation Handbook*. The U.S. Public Health Service Clinical Practice Guideline (Fiore, 2000) and the treatment model described by Richard Brown (2003) provided the foundation for their work and therefore indirectly ours as well.¹

Many thanks to Kim Hamlett-Berry, Director of Tobacco & Health Policy in Clinical Public Health, Office of Public Health, for supporting this project and Leah Stockett for editing the manual and the workbook. In addition, much appreciation needs to be given to Dana Christofferson, Kim Hamlett-Berry, Pam Belperio, and Tim Chen for their editing and content contributions.

I. Tobacco Use in VA’s Population

CHAPTER SUMMARY

Scope of the problem

- In 2011, approximately 19% percent of the adult population in the United States smoked.
- Smoking accounts for more than 443,000 deaths each year in the United States\(^1\).
- Smoking is a known cause of multiple cancers, heart disease, stroke, complications of pregnancy, chronic obstructive pulmonary disease (COPD), and many other diseases\(^2,3\).
- Smoking prevalence in the Veteran population has been reported to be similar to the general U.S. population with approximately 20% of Veterans reporting smoking in 2010.
- In 2008, rates of smoking among Veterans of the Iraq and Afghanistan wars were approximately 33%, with rates of smokeless tobacco use at 14%\(^5\).
- Tobacco dependence is a chronic disorder that often requires repeated interventions and multiple quit attempts.

Benefits of smoking cessation in primary care patients

- Smoking cessation can reduce and prevent many smoking-related health problems.
- Smoking is the most clinically important modifiable cardiovascular risk factor for all patients.
- The improvements after quitting tobacco are noticeable within the first few days after stopping.
- Every attempt to quit improves the probability of eventual success\(^6\).

VA’s primary care provider’s role

- Address tobacco use at every visit. Effectiveness starts with the clinical routine of:
  - **Asking** every patient about tobacco use
  - **Advising** patients to quit at every visit
  - **Assessing** all patients’ readiness to quit at every visit
  - **Assisting** all patients willing to make a quit attempt with counseling and cessation medications
  - **Arranging** for follow up for patients making a quit attempt
CHAPTER SUMMARY

- Approach tobacco use as a chronic illness, which includes monitoring repeated quit attempts and relapses
- Counsel and prescribe medications to assist with cessation
- Help patients access comprehensive care to address co-morbidities affecting their ability to quit
- Utilize an integrated model of care and provide a consistent message about the importance of quitting tobacco use
- Use a team approach as it results in greater efficacy in long-term follow up and prescribing tobacco cessation medications

Challenges to tobacco cessation in VA primary care

- Higher rates of tobacco use in many Veteran groups including Veterans of Iraq and Afghanistan wars, mental health patients, and HIV-infected patients
- Integrating tobacco cessation counseling into all patient care areas including primary care, mental health, and specialty clinics
- Changing the delivery of tobacco cessation services to address tobacco use and dependence in a chronic disease model

SCOPE OF THE PROBLEM

Impact of Tobacco Use on Morbidity and Mortality

Smoking is the leading cause of preventable death and disease in the United States. Smoking is the leading cause of preventable death and disease in the United States. Cigarette smoke contains more than 7,000 chemicals, including hundreds of chemicals that are toxic and approximately 69 that can cause cancer. It is a chronic disorder that often requires repeated interventions and multiple attempts to quit.

- In the United States, the current prevalence of tobacco use among adults has dropped from 44% in the 1960s to approximately 19% in 2011.

- The adverse health effects from cigarette smoking account for an estimated 443,000 annual deaths, or nearly one of every five deaths in the United States.

- More deaths are caused each year by tobacco use than by all deaths from human immunodeficiency virus (HIV), illegal drug use, alcohol use, motor vehicle injuries, suicides, and murders combined.
I. Tobacco Use in VA’s Population

- Smoking causes an estimated 90% of all lung cancer deaths in men and 80% of all lung cancer deaths in women.\(^3\)

- An estimated 90% of all deaths from chronic obstructive lung disease are caused by smoking.\(^3\)

- The risk of heart attack and stroke are much higher in tobacco users compared to people who do not use tobacco.

- Smoking-attributable health costs are estimated at $96 billion per year in direct medical expenses and $97 billion in lost productivity.\(^{11}\)

- Light smoking is dangerous to the health of those who smoke. The Surgeon General’s report on how tobacco causes disease documents in great detail how both direct smoking and secondhand smoke causes damage not only to the lungs and heart, but to every part of the body.\(^7\) Researchers found that inhaling cigarette smoke from one cigarette causes immediate changes to the lining of blood vessels and that light smoking may be almost as detrimental as heavy smoking.

**BENEFITS OF TOBACCO CESSATION**

Smoking cessation can reduce and prevent many smoking-related health problems. The benefits of quitting tobacco can be noticed in the first few days after stopping.\(^3\)

- Smoking cessation lowers the risk for lung and other types of cancer within 10 years after stopping.

- Tobacco cessation reduces the risk of stroke, heart disease, and peripheral vascular disease. Coronary heart disease risk begins to decline within 1-2 years of stopping tobacco.

- Smoking cessation reduces coughing, wheezing, and shortness of breath. The rate of decline in lung function that occurs with aging is slower among persons who quit tobacco.

- Smoking cessation reduces the risk of developing chronic obstructive pulmonary disease (COPD).

- Smoking increases the rate of infertility in women during their reproductive years. Women who stop smoking during their reproductive years have a reduced risk of infertility and women
who stop smoking during pregnancy reduce the risk of having a low birth-weight baby.

- Every attempt to quit improves the probability of eventual success.

THE ROLE OF THE PRIMARY CARE PROVIDER

Assess tobacco use at every visit with Veterans. This can be done by multiple providers during a visit, including but not limited to medical assistants, nurses, physicians, nurse practitioners, physician assistants, pharmacists, and other members of the health care team. It is estimated that 70% of current adult smokers in the United States want to quit and millions have attempted to do so. Tobacco dependence is a chronic disorder that often requires repeated interventions and multiple quit attempts. Limits should not be placed on how often Veterans can attend counseling sessions or receive medication. Methods to quit tobacco use include:

- Brief clinical interventions (≤10 minutes)
  - Provider offering counseling with “advice to quit” and assistance with quitting

- Counseling (≥10 minutes)
  - Individual
  - Group
  - Telephone

- Medications to help with tobacco cessation
  - Nicotine replacement therapy (NRT)
  - Non-nicotine medications
    - Bupropion
    - Varenicline
  - The combination of medication and counseling is more effective for tobacco cessation than either medication or counseling alone.

CHALLENGES TO TOBACCO CESSION IN VA PRIMARY CARE PATIENTS

Rates of tobacco use are higher in many Veteran groups, including Veterans of the Iraq and Afghanistan wars, mental health patients, and HIV-infected patients. Quitting tobacco products can be more challenging in these patient groups, however there are effective models of care for smoking cessation
interventions in these patients. Establishing programs to help support cessation attempts can increase cessation rates. Veterans with posttraumatic stress disorder (PTSD) smoke and use tobacco at higher rates than Veterans without PTSD. An integrated model of smoking cessation with primary care providers and staff that provided consistent care for Veterans with PTSD was found to be effective and superior to standard-of-care smoking cessation programs given separately from the primary care clinic.

- Veterans with psychiatric disorders smoke at higher rates than those without mental health disorders. Studies in populations with psychiatric disorders and depression suggest moderate efficacy of smoking cessation and little or no evidence of exacerbation of these disorders.

- Approximately half of alcohol dependent individuals are daily smokers. Evidence indicates that smoking cessation interventions for individuals with alcohol use disorder are effective and have no detrimental effects on abstinence from alcohol. Study results are mixed regarding optimal timing of smoking cessation interventions for individuals with alcohol use disorder. Smoking status should be addressed for all individuals with alcohol use disorder and the following recommendations have been proposed:

  - Smoking cessation interventions should be offered to all alcohol use disorder patients who smoke
  - A menu of options about how and when to stop should be offered
  - Timing of smoking cessation interventions (concurrent versus delayed) should be based on patient preference

- HIV-infected smokers have a greater probability of non-AIDS related diseases such as cardiovascular and pulmonary conditions (pneumothorax, pneumonia, lung cancer) and non-AIDS cancers. Cigarette smoking is the most important modifiable cardiovascular risk factor among HIV-infected patients, more so even than the use of lipid-lowering drugs or ART.

- Tobacco use is more prevalent in the Veterans from Operation Enduring Freedom and Operation Iraqi Freedom (OEF/OIF) than in the general Veteran population. Veterans returning home from Iraq and Afghanistan report they continued to smoke as a way to modulate negative moods (e.g., anger dysregulation, irritability, stress); cope with a post deployment shift to civilian life; and deal with combat-related injuries, unstructured life outside of the
military, sleep disorders, and the inability to turn off the military mindset (e.g., hypervigilance).\textsuperscript{26}

- Concurrent tobacco use is the use of cigarettes along with another form of tobacco like chewing tobacco, cigars or pipes. The rates of concurrent tobacco use are increasing and this is felt to be due at least in part to restrictions on cigarette smoking in indoor locations. In a 2008 report, 41\% of active duty military personnel reported using at least one form of tobacco in the previous month. Heavier rates of smoking (more than 15 cigarettes a day) was associated with a higher rate of using multiple forms of tobacco (cigarettes, cigars and chewing tobacco).\textsuperscript{27}

This page intentionally left blank.
II. Tobacco Cessation Interventions

CHAPTER SUMMARY

- Effective interventions can be brief (3-10 minutes) or intensive (lasting for >10 minutes)
- Brief 3-minute interventions advising patients to quit can enhance abstinence rates
- Even without a tobacco cessation program, brief counseling and medications provided as part of ongoing health care can be effective
- When creating a tobacco cessation program, start small and manageable by selecting brief interventions appropriate for the setting
- Identify primary care providers and key staff with an interest in tobacco cessation
- Build the program by incorporating more intensive interventions when appropriate
- Monitor and track your patients’ progress

EFFECTIVENESS OF TOBACCO CESSION INTERVENTIONS

Tobacco cessation interventions can be extremely effective and providers who perform even brief interventions of ‘advice to quit’ to patients can significantly increase abstinence rates. Health care providers should present a clear, concise, and consistent “quit” message to all their patients who use tobacco. The evidence on tobacco cessation interventions referenced below is presented in full in the U.S. Department of Health and Human Services (DHHS), Public Health Service (PHS), Treating Tobacco Use and Dependence: 2008 Update (Clinical Practice Guideline).\(^1\)

Any type of clinician can be effective at delivering evidence-based interventions to increase quit rates. There is strong evidence of a dose-effect response, as the more intense the cessation intervention, the greater the rate of abstinence. Intervention intensity can be increased by extending the length and number of individual treatment sessions.\(^1\) Cessation counseling lasting 4-30 minutes can double a patient’s chance of abstinence whereas counseling lasting more than 30 minutes can triple a patient’s chance of success.\(^1\) Conducting 2-3 counseling sessions increases abstinence rates by 1.5 fold while conducting 4-8 sessions double the chance of success.\(^1\)

It is important to remember that brief counseling and medications provided as part of an ongoing therapeutic relationship can be as or more effective than...
II. Tobacco Cessation Interventions

A referral to an outside clinic, tobacco cessation program or the prescribing of medication alone. Self-help, pro-active group counseling and telephone counseling have all been shown to significantly increase abstinence rates compared to stopping “cold turkey.”

ESTABLISHING A TOBACCO CESSATION PROGRAM FOR VETERANS IN PRIMARY CARE CLINICS

Implementing a sustainable and effective tobacco cessation program can feel daunting, but several key strategies can be helpful when implementing an effective tobacco cessation program in your primary care clinic. As you start to build a program in your clinic, identify providers and staff who are interested in tobacco cessation as these “local champions” can help build momentum for the program and get other providers involved. As more providers become interested, you can start to implement more intensive cessation interventions. Monitoring and tracking patients’ progress over time can provide helpful feedback to staff so they can see the impact of their work. Finally, there is a Smoking Cessation Lead Clinician and a Health Behavior Coordinator at each VA facility who can be a valuable resource for your clinic. Please email publichealth@va.gov to obtain the name of the Smoking Cessation Lead Clinician at your VA facility.

TOBACCO CESSATION BEHAVIORAL INTERVENTIONS

This chapter describes interventions to use when talking with your patients about their interest in tobacco cessation. These brief and intensive interventions have been used in health care settings and range from 3-10 minute conversations to intensive counseling that can last an hour. Challenges and opportunities for implementing these well-established interventions with your primary care patients and making tobacco cessation a routine part of clinical care are also addressed.

Brief Interventions (3-10 minutes)

The most important factor in tobacco cessation is engaging patients. Providing patients with information about the impact of tobacco use, assessing their level of motivation to quit, and helping them move to the next step in cessation through the provision of resources or referrals to tobacco cessation programs, are critical components of brief interventions. The five elements of a brief tobacco cessation intervention are outlined below.
II. Tobacco Cessation Interventions

TABLE 1. THE 5 A’S OF TOBACCO CESSATION INTERVENTIONS

ASK about smoking*

Ask patients about tobacco use at every clinic visit

- Ask about the type(s) of tobacco used and how long it has been used
- If a patient quit years ago, congratulate and check in periodically

*Clinical reminders and performance measures within VHA can assist with this element

ADVISE patient to quit

Provide clear, strong, and personalized suggestions

- Clear: I think it is important that you quit smoking. I can help.
- Strong: Quitting smoking is one of the most important things you can do to protect your health.
- Personalized: Associate smoking with something that is important to the patient, such as the increased risk of harm to their body, exposure of children or pets to tobacco smoke, the expense of cigarettes, or pulmonary and cardiovascular comorbidities.
  - Your smoking habit can increase your risk of heart attacks and strokes.
  - Remember the time you had that terrible pneumonia?
  - Do you realize that you can save more than $2,000 a year on cigarette expenses if you quit?

ASSESS readiness to quit

Assess patient’s readiness to quit within the next 30 days

- Are you willing to give quitting a try in the next 30 days?
  - If patient is ready, assist patient using the follow-up activities in the ARRANGE section (p. 18).
  - If the patient is not ready to quit, consider using motivational interviewing to increase their readiness (See Table 2. Enhancing Motivation to Quit Tobacco, The 5 R’s on p. 19).

ASSIST patients with their quit attempt

Prepare your patient for quitting using STAR. Have them:

- Set a target quit date (TQD). Ideally, the TQD should be within two
II. Tobacco Cessation Interventions

weeks, but no later than within 30 days. The TQD should be a date the patient feels comfortable with and gives them enough time to prepare.

- Tell family, friends, and coworkers about quitting, and request understanding and support.
- Anticipate challenges to the upcoming quit attempt, particularly during the critical first few weeks. These include nicotine withdrawal symptoms.
- Remove tobacco products from their environment. Before quitting, they should avoid smoking in places where a lot of time is spent (e.g., work, home, car) and make their home smoke free.

**Offer pharmacotherapy and discuss the role of medications in treatment**

**Provide practical counseling (problem-solving/skills training)**

- Offer intensive treatment options (e.g., tobacco cessation classes, telephone counseling) available within your VA facility.
- Provide a supportive clinical environment while encouraging the patient in his or her quit attempt.
- Provide supplementary materials and other resources to keep the patient motivated and engaged.

**ARRANGE follow-up encounters**

**Arrange patient follow-up contact by phone or in clinic (enroll patient in a VHA-based smoking cessation clinic, if s/he requests)**

- **Timing**
  - The first follow-up encounter should be around the TQD or within the first week
  - The second follow-up encounter should be within the first month of the TQD

- **Actions to take during follow-up encounters**
  - Assess medication use and any adverse reactions
  - Remind patient of reasons for quitting and other resources available to them
  - Congratulate patient on abstinence

- Provide supplementary materials and other resources such as the *My Tobacco Cessation Workbook* to keep the patient motivated and engaged
II. Tobacco Cessation Interventions

For providers with less time or comfort, the 5 A’s can be modified to AAR: Ask → Advise → Refer, where the patient is referred to existing smoking cessation services.

**Intensive Intervention (>10 minutes)**

The components of an intensive tobacco cessation intervention consist of:

- Determining whether tobacco users are willing to make a quit attempt with intensive counseling
- Conducting patient assessments that may be helpful including lung function, stress level, and nicotine dependence using the Fagerström Test for Nicotine Dependence (See Table 3. Fagerström Test for Nicotine Dependence on p. 26)
- When possible, conducting sessions longer than 10 minutes and including ≥ 4 sessions
- Combining behavioral counseling and medication (essential to successful tobacco cessation treatment)
- Including problem solving/skills training and intra-treatment social support as part of the intervention

**IDENTIFYING REASONS TO QUIT**

It is important to help patients identify reasons for quitting. The following intervention, based on motivational interviewing, can help motivate patients who are not quite ready to quit.

**TABLE 2. ENHANCING MOTIVATION TO QUIT TOBACCO, THE 5 R’S**

<table>
<thead>
<tr>
<th>RELEVANCE</th>
<th>Explain why cessation is personally relevant</th>
</tr>
</thead>

<td>Increased risk of heart attack and stroke</td>
</tr>
</tbody>
</table>
II. Tobacco Cessation Interventions

- Reduced circulation in legs (peripheral artery disease), which can increase risk of amputation
- Increased risk of cancers like lung, bladder, pancreas, esophageal, stomach, and head and neck cancers
- Increased risk of osteoporosis and bone fractures
- Increased risk of lung damage leading to emphysema
- Smoking is a common cause of sexual dysfunction

**REWARDS** Ask patients to explain what they might gain from tobacco cessation and highlight the rewards most relevant to the patient

- Improved taste of food
- Improved sense of smell
- Saving money
- Setting a good example for children
- Better performance of physical activities
- Improved appearance (e.g., reduced wrinkling, whiter teeth)
- Lower risk of heart disease
- Lower risk of lung disease
- Lower risk of tobacco-related cancers

Explain that:

- 20 minutes after quitting, heart rate and blood pressure drop
- Two weeks to three months after quitting, circulation and lung function improve by 30%
- One year after quitting, risk of coronary heart disease (CHD) is reduced by 50%
- Five years after quitting, stroke risk is similar to that of someone who never smoked

**ROADBLOCKS** Ask patients to identify barriers to quitting and offer options to address those barriers

- Withdrawal symptoms
- Fear of failure
- Weight gain
- Lack of support
II. Tobacco Cessation Interventions

- Depression
- Enjoyment of smoking
- Socializing with other smokers

REPETITION Discuss the R's listed above with patients visit
II. Tobacco Cessation Interventions

CHAPTER SUMMARY

- Tobacco use and dependence can be a chronic, relapsing condition
- Consider tracking tobacco use as a vital sign
- Provide factual information to address patient concerns
- Assess patient’s tobacco use status and readiness to quit
- Advise patients about quitting
- Encourage confidence in quitting

APPROACHING PATIENTS ABOUT TOBACCO CESSATION

Though primary care providers are in an excellent position to provide tobacco cessation interventions with their patients who use tobacco products, it can be difficult and sometimes uncomfortable to approach the topic. We recommend treating tobacco use as a vital sign so that a patient’s tobacco use status is readily apparent upon their entrance into the exam room. This is an easy way to integrate conversations about tobacco use into the clinic visit. Tobacco use can be a chronic, relapsing condition that at times requires varying levels of intervention. We encourage you to go as far as you can with each patient at each visit as you help lay the groundwork for tobacco cessation.

In order to assess your patient’s level of nicotine dependence, we suggest using the test in Table 3. Fagerström Test for Nicotine Dependence (p. 26). The level of your patient’s nicotine dependence has important indications for the regimen that should be suggested for treatment.

### ADDRESSING PATIENT CONCERNS AND SAMPLE SCRIPTS

In the following tables, you will find helpful methods for discussing tobacco use and tobacco cessation with your patients.

#### TABLE 4. SAMPLE RESPONSES TO PATIENTS’ CONCERNS ABOUT TOBACCO CESSATION\(^3\)-\(^5\)

<table>
<thead>
<tr>
<th>Patient</th>
<th>Provider</th>
</tr>
</thead>
</table>
| I don’t want counseling, I only want medication.                       | ■ Counseling and medication works better than medication alone.  
                                                                 | ■ Counseling will provide you with practical skills to support the behavior changes necessary to quit. |
| I want to try acupuncture, hypnosis, or laser therapy.                 | ■ Reinforce the evidence supporting the effectiveness of counseling and medication.  
                                                                 | ■ Suggest that the patient augment any substandard therapy with counseling and medication. |
| I am concerned that I will gain weight once I quit smoking.            | ■ Start to increase physical activity as soon as possible.  
                                                                 | ■ Consider taking a walk instead of a cigarette break. |
| I don’t understand how nicotine replacement therapies (NRTs) could be harmless if nicotine is also one of the harmful drugs in cigarettes. | ■ Studies have shown that medicinal nicotine is safe.  
                                                                 | ■ What is harmful in cigarettes are the 7,000 other chemicals, including 69 carcinogens.  
                                                                 | ■ Medicinal nicotine in dosages approved for NRT medications are proven to greatly reduce withdrawal symptoms during tobacco cessation. |
### III. Real-time Scripts for Brief Tobacco Cessation Interventions

<table>
<thead>
<tr>
<th>Patient</th>
<th>Provider</th>
</tr>
</thead>
</table>
| **My life is too stressful to quit tobacco.** | ■ Smoking/chewing is one way that many people deal with stress.  
■ Counseling will help you develop new and healthier ways to cope with your stress. |
| **I have been smoking for 30 years and I have no health problems. Plus, my grandmother smoked all her life and she lived to be 100.** | ■ Some people who smoke do not develop health consequences, however about 50% of people who smoke will die from cigarette-related consequences.  
■ The average smoker lives 10 years less than a non-smoker. |
### Approach your patients about smoking/chewing

#### Assess tobacco status

- How many cigarettes do you smoke a day? How many cans of chewing tobacco do you use in a week?
- Do others in your household or work environment smoke/chew?
- Have you thought about quitting?

#### Advise patient about quitting tobacco

**Be clear**

- I think it is important that you quit smoking/chewing. I can help.

**Make strong statements**

- Quitting smoking is one of the most important things you can do for your health.
- Smoking can greatly increase your chances of having a heart attack or stroke.
- Chewing tobacco is directly linked to cancers in the mouth and throat.

**Personalize your feedback**

- Your smoking habit may be a more serious risk to your health right now than your diabetes.
- You can save more than $2,000 a year on cigarette expenses if you quit.
- All your hard work improving your diet and working on reducing your blood pressure is being undone by smoking.
- Your risk of lung disease, coronary heart disease, and other problems are much higher.
- You are at increased risk of developing lung disease and lung cancer when you smoke.
- You complain of shortness of breath; giving up cigarettes will improve your breathing and stamina.
III. Real-time Scripts for Brief Tobacco Cessation Interventions

Assess patient’s readiness to quit

- Are you willing to give quitting a try in the next 30 days?
- Let's get specific, how much do you want to cut back by the next time I see you?

Assess and build motivation

- How confident do you feel (on a scale of 1-10) that you can quit? What would move that number further up the scale for you?
- What would have to happen for it to become much more important for you to change?
- I believe you can do this. It’s a tough thing to give up. Let's think about what some of the main barriers are that might get in the way of you being able to do this.

Support self-efficacy

- So, getting support from your non-smoking friends was a helpful strategy last time you quit.
- You've been really successful in managing your diabetes (or other) medication regimens and you can use some of those same skills here.
- Would you like some resources about smoking cessation that you can read on your own time while you decide?

Encourage confidence in quitting tobacco

- On a 10-point scale, how confident are you in your ability to stop tobacco for good?
- What would make you more confident in your ability to stop tobacco?
- What did you learn from your past quit attempts?
- How might your past relapses be able to help you with this new attempt?
- Is there anything you found helpful in previous attempts to stop tobacco?

Emphasize personal choice and responsibility

- It is up to you to decide when you're ready and how to quit. I'm here to help you whenever you're ready.
- It sounds like you're not ready to think about quitting. It's one of the things we consider like a vital sign so I'll be asking about it
when you come in for your next visit. Just let me know when you feel ready to make a change.

- You’re interested in quitting, that’s an important step. Here’s what we have available to help you (e.g., counseling services, medications). What would you be interested in trying first? If you would like, I can tell you some strategies that will help you address those concerns.

Express empathy

- Lots of people worry about how they’ll be able to manage without tobacco.

- Sounds like you’re not ready to quit today, I know this is a tough decision. I’m here to help you whenever you decide you’re ready to quit or start to cut down.

IV. Medications for Tobacco Cessation
IV. Medications for Tobacco Cessation

CHAPTER SUMMARY

- Use of medications for tobacco cessation result in better abstinence rates and durability than quitting “cold turkey”
- Tobacco cessation medications help address the physiological symptoms experienced during a quit attempt, which reduces cravings and the potential for relapse in the early stages of a quit attempt
- Medications for tobacco cessation are most successful when combined with other interventions (e.g., counseling, monitoring and tracking). Use Table 3. Fagerström Test for Nicotine Dependence (p. 26) to guide prescribing
- The goal of titration is to eliminate the need for NRT while maintaining tobacco abstinence
- Nicotine pharmacology considers the dose response and manages withdrawal symptoms, which commonly include irritability, impatience, anxiety, difficulty concentrating, restlessness, hunger, depression, insomnia, and cravings
- Selection of the tobacco cessation medication should be based on the person’s level of addiction to tobacco, product preference, and concomitant medical conditions
- Consider combination therapy in patients with high dependence, those who are heavier users, or those experiencing cravings or withdrawal symptoms while on the patch alone
- Consider combination therapy of nicotine patch plus nicotine polacrilex gum or nicotine lozenge for maximum management of withdrawal symptoms

NICOTINE PHARMACOLOGY

First-line FDA-approved agents for smoking cessation consist of nicotine replacement therapies (NRTs), which include the nicotine patch, gum, lozenge, oral inhaler and nasal spray; and the non-NRT agents bupropion and varenicline. Within VA, varenicline is a second-line agent for smoking cessation and the nicotine oral inhaler and nicotine nasal spray are nonformulary agents. Combination therapy using the nicotine patch plus either nicotine gum, nicotine lozenge, or bupropion is also recommended as a first-line treatment option.
IV. Medications for Tobacco Cessation

FIGURE 1. EFFICACY OF MEDICATIONS FOR SMOKING CESSATION

Nicotine Withdrawal

Once absorbed, nicotine induces a variety of central nervous system, cardiovascular, and metabolic effects. Within seconds after inhalation, nicotine reaches the brain and stimulates the release of various neurotransmitters including dopamine, which produces nearly immediate feelings of pleasure and relieves nicotine-withdrawal symptoms. This rapid dose response reinforces the need to repeat the intake of nicotine, thereby perpetuating smoking behavior.

The main purpose of nicotine pharmacology is to minimize a person’s nicotine withdrawal symptoms when they quit tobacco. When nicotine is discontinued, individuals may develop withdrawal symptoms such as irritability, impatience, anxiety, difficulty concentrating, restlessness, hunger, depression, insomnia, and cravings. Most physical withdrawal symptoms generally manifest within 24-48 hours after quitting and gradually dissipate over 2-4 weeks; however, strong cravings for tobacco can persist for months or even years.
NICOTINE REPLACEMENT THERAPY (NRT)

The mechanism of action of NRTs, which are ganglionic (nicotinic) cholinergic-receptor agonists, is to replace nicotine that would have been obtained from smoking. These agents improve quit rates by reducing the symptoms of nicotine withdrawal. The onset of action with NRT is not as rapid as that of nicotine obtained through a cigarette, so patients become less accustomed to the nearly immediate reinforcing effects of tobacco. The goal is to use NRT to taper off of nicotine over a few months. Table 6. Medications for Tobacco Cessation Available Through the VA National Formulary (p. 47) summarizes the dosing regimens, advantages and disadvantages, common adverse effects, and contraindications for three forms of NRT, bupropion, and varenicline.

Treatment of nicotine dependence with NRT should adhere to the following principles:

- **Dose to effect:** The initial dose should be sufficient to provide the patient with a nicotine dose similar to that seen prior to stopping cigarettes. Providers should always assess the patient’s nicotine dependence before prescribing cessation aids. (See Table 3. Fagerström Test for Nicotine Dependence on p. 26). Treat withdrawal symptoms—the nicotine replacement dose should be sufficient to prevent or minimize craving for tobacco products.

- **Avoid adverse reactions:** The nicotine replacement dose should be titrated so that signs and symptoms of overmedication (e.g., headache, nausea, palpitations) do not occur.

- **Advise the patient to try not to use cigarettes while using NRT:** Encourage the patient to report to their provider if they have severe cravings, which may indicate reevaluation of dosage and type of NRT (consider use of combination NRT, such as the patch or gum). If the patient has a slip and uses tobacco while using NRT, encourage the patient to try to get back on track with quitting tobacco. If they are not using combination therapy, then this should be considered to help them abstain completely from tobacco. If they have a relapse and are back to smoking daily, then it may be best to have them quit the NRT and set another quit day when they are ready to try again.

- **Selection of the type of NRT should be based on the person’s level of addiction to tobacco, product preference, and concomitant medical conditions:** Consider combination therapy in patients with high dependence or in those who are heavy smokers.
IV. Medications for Tobacco Cessation

Nicotine transdermal patch\(^4\)\(^-\)\(^6\)

- Although the patch has the slowest onset of all the nicotine preparations, it offers more consistent levels of nicotine over a sustained period of time resulting in fewer blood level fluctuations. Plasma nicotine concentrations rise slowly over 1-4 hours and peak within 3-12 hours.

- Steady-state concentration is reached 2-3 days after placement of first patch; following removal of the transdermal patch, the apparent half-life averages 3-6 hours. Plasma nicotine levels are about 50% lower than those achieved with cigarette smoking, but symptoms of withdrawal can still be alleviated.

- Can be applied anywhere on the upper body, including arms and back, avoid hairy areas; rotate the patch site each time a new patch is applied.

- Available OTC in the community.

Nicotine polacrilex gum\(^6\)\(^-\)\(^9\)

- Resin complex of nicotine and polacrilin in a sugar-free chewing gum base. Gum has a distinct peppery taste and contains sodium carbonate/bicarbonate buffers to increase salivary pH thereby enhancing absorption of nicotine across the buccal mucosa. The amount of nicotine absorbed from each piece is variable (approximately 1.1 mg and 2.9 mg from the 2 mg and 4 mg formulations, respectively).

- Patients should be advised to use a bite-and-park method when using the nicotine gum. They should bite the gum several times until they taste a peppery taste or feel a tingling sensation, then park the gum on the inside of their cheek where the nicotine will be absorbed. When they no longer taste the peppery taste or feel the tingling sensation, then they should bite the gum several times again and park the gum in the inside of their cheek. This should be repeated until they no longer taste the peppery taste. The gum should not be chewed continuously like regular chewing gum or the nicotine will not be absorbed and the patient may experience stomach upset and heartburn.

- Nicotine plasma levels peak approximately 30 minutes after chewing a piece of gum and slowly decline over 2-3 hours. Provides plasma nicotine concentrations approximately 30-64% of precession levels.

- Allows smokers to take an active coping response to nicotine
withdrawal symptoms.

- Associated with less weight gain compared to placebo during treatment.

- Sticks to dentures, may dislodge fillings and inlays because of the density and texture of the gum.

- Patients should be advised not to eat or drink for 15 minutes before, during or after using. Acidic beverages (e.g., coffee, juice) inhibit the absorption of nicotine and should be avoided within 15-20 minutes of use.

- Available OTC in the community.

**Nicotine polacrilex lozenge**

- Resin complex of nicotine and polacrilin in a flavored lozenge intended to be dissolved in mouth and moved from side to side in the mouth until fully dissolved. Lozenge contains sodium carbonate/potassium bicarbonate buffers to increase salivary pH thereby enhancing absorption of nicotine across the buccal mucosa.

- Patients should be advised to place the lozenge in their cheek to allow the lozenge to be absorbed. They should not bite or chew the lozenge.

- Nicotine plasma levels peak in approximately 30 minutes and slowly decline over 2-3 hours. Because the lozenge dissolves completely, it delivers about 25% more nicotine than does an equivalent dose of nicotine gum.

- Allows smokers to take an active coping response to nicotine withdrawal symptoms.

- Potential to consume too quickly, which may cause symptoms of high nicotine levels (e.g., nausea, gastrointestinal upset).

- Patients should be advised not to eat or drink for 15 minutes before, during or after using. Acidic beverages (e.g., coffee, juice) inhibit the absorption of nicotine and should be avoided within 15-20 minutes of use.

- Available OTC in the community.
IV. Medications for Tobacco Cessation

**Nicotine nasal spray**6-10 *(not on VA national formulary)*

- Aqueous solution of nicotine available in a metered-spray pump for administration to nasal mucosa. Each actuation delivers a 50 mcL spray containing 0.5 mg of nicotine.

- Peak concentrations occur more rapidly than with other NRT products; plasma levels peak within 5-15 minutes resembling the kinetics of nicotine seen with cigarette use; approximately 53% is absorbed.

- Due to its faster onset, capacity for self-titration, and rapid fluctuations of nicotine levels, the nasal spray has the highest potential for developing dependence.

- Local irritant adverse effects including nasal and throat irritation, runny nose, sneezing, watery eyes, and cough may occur. These effects frequently dissipate after the first week of use.

- Not recommended for patients with known chronic nasal disorders or severe reactive airway disease.

**Nicotine oral inhaler**6-9,11 *(not on VA national formulary)*

- Consists of a plastic mouthpiece and cartridge that delivers nicotine as an inhaled vapor from a porous plug containing nicotine. When puffed, nicotine is vaporized and absorbed across the mucosa of the mouth and throat (not the lungs).

- Each foil sealed cartridge contains 10 mg of nicotine and 1 mg of menthol. Plastic spikes on the mouthpiece pierce the foil allowing the release of 4 mg of nicotine vapor following intensive inhalation of which about 2 mg is absorbed.

- Peak plasma concentrations occur within 15-30 minutes and then slowly decline.

- High residual level of nicotine in discarded cartridge can be dangerous to children and pets.

- High incidence of mouth and throat irritation.

- Use cautiously in patients with severe reactive airway disease.

- Delivery of nicotine from the inhaler declines significantly at temperatures below 40°F.

- Patients should be advised not to eat or drink for 15 minutes before, during or after using. Acidic beverages (e.g., coffee, juice)
inhibit the absorption of nicotine and should be avoided within 15-20 minutes of use.

*Please note the nicotine oral inhaler is not the same as electronic cigarettes, which are not FDA-approved for smoking cessation treatment.*

**Combination Nicotine Replacement Therapy**\(^6,9,12-15\)

Combination NRT involves the use of a long-acting formulation (e.g., nicotine patch) along with a short-acting formulation (e.g., nicotine gum, nicotine lozenge, nicotine inhaler, or nicotine nasal spray).

A nicotine patch provides a passive sustained form of nicotine delivery and is used to prevent the onset of severe withdrawal symptoms. Short-acting formulations provide an ad libitum delivery that has a faster onset and can be used to control the strong cravings or urges that occur during potential relapse situations (e.g., after meals, during times of stress, when around other smokers).

Controlled trials suggest that the nicotine patch in combination with short-acting NRT formulations significantly increases quit rates relative to placebo and the nicotine patch alone. Combination therapy with the nicotine patch and either nicotine gum or lozenge is superior to monotherapy with the nicotine patch in up to one year of follow up. Using a combination of nicotine patch plus long-term nicotine gum (>14 weeks) has been shown to more than triple the likelihood of long-term abstinence (OR = 3.6, 95% CI 2.5-5.2). Similarly, studies evaluating the nicotine patch in combination with the nicotine lozenge for 12 weeks have resulted in abstinence rates of up to 40% at six months.

**Combination NRT Example Taper Schedule**

- **Week 1:** Nicotine 21mg patches and 5 lozenges daily
- **Week 2:** Nicotine 21mg patches and 4 lozenges daily
- **Week 3:** Nicotine 21mg patches and 3 lozenges daily
- **Week 4:** Nicotine 21mg patches and 2 lozenges daily
- **Week 5:** Nicotine 21mg patches and 1 lozenge daily
- **Week 6:** Nicotine 14mg patches and 4 lozenges daily
- **Week 7:** Nicotine 14mg patches and 3 lozenges daily
- And so forth...

**Use behavioral strategies previously listed to assist with taper of NRT**
IV. Medications for Tobacco Cessation

Nicotine Replacement Therapy Safety\textsuperscript{6,9,16-18}

Nicotine can increase one’s heart rate, blood pressure, and myocardial contractility, and also act as a coronary vasoconstrictor. In patients with stable coronary artery disease, NRT can be initiated at intermediate doses with careful monitoring. Large randomized trials have found no significant increase in the incidence of cardiovascular events or mortality among patients with cardiovascular disease receiving NRT when compared to placebo. A large observational study of more than 33,000 patients found that NRT use was not associated with an increased risk of myocardial infarction, stroke, or death. Serum concentrations of nicotine achieved with the recommended dosages of NRT are generally much lower than those attained with smoking and most experts agree that the risks associated with NRT use in patients with cardiovascular disease are minimal relative to the risks of continued smoking.

Other conditions for which NRT should be used with caution include active temporomandibular joint (TMJ) disease (specifically, nicotine gum), hyperthyroidism, peptic ulcer disease, and severe renal impairment. Although the FDA has developed a uniform warning for all NRTs because of the risks of nicotine in pregnancy, they believe that NRT is safer than smoking during pregnancy.

The safety of NRT in the elderly has not been systematically evaluated. However, one small pharmacokinetic study concluded that though there were statistically significant differences, the disposition of nicotine does not seem to be changed to a clinically important extent in the elderly compared to younger subjects.

BUPROPION\textsuperscript{6,19-23}

Bupropion (Zyban\textsuperscript{®}, Wellbutrin\textsuperscript{®}) is a weak dopamine-norepinephrine reuptake inhibitor with some nicotine receptor blocking activity.\textsuperscript{19,20} The mechanism by which bupropion enables patients to abstain from smoking is unknown. However, it is presumed that bupropion acts by enhancing central nervous noradrenergic and dopaminergic release and antagonizes nicotinic acetylcholine receptor function. The antismoking effect of bupropion does not seem to be related to the antidepressant effect, as bupropion is equally effective as a smoking cessation therapy in smokers with or without depression.\textsuperscript{21}

- Steady-state levels of bupropion and metabolites are reached within 5-8 days, respectively. It is best to start bupropion one week before one’s target quit date.
- In patients with severe hepatic cirrhosis, extreme caution is advised since peak bupropion levels are substantially increased. For patients
IV. Medications for Tobacco Cessation

with mild-to-moderate hepatic cirrhosis, a reduced frequency or dose should be considered.

■ Bupropion should be used with caution in patients with renal impairment and a reduced frequency of dosing should be considered. Patients should also be closely monitored for possible adverse effects that could indicate high drug or metabolite effects.

■ Bupropion has the potential to interact with other drugs that are metabolized by or which inhibit/induce the CYP2B6 isoenzyme. It can also interact with drugs metabolized by the CYP2D6 isoenzyme.

■ Other inducers such as carbamazepine, phenobarbital, and phenytoin can lower bupropion levels via induction of bupropion metabolism.

■ Bupropion and hydroxybupropion (one of its metabolites) are inhibitors of CYP2D6 in vitro. Since the interactions between bupropion and drugs metabolized by CYP2D6 have not been formally examined, caution is advised in the coadministration of bupropion with drugs metabolized by CYP2D6. If adding a drug metabolized by CYP2D6 (e.g., nortriptyline, imipramine, desipramine, paroxetine, fluoxetine, sertraline, haloperidol, risperidone, thioridazine, metoprolol, propafenone, flecainide) to a patient already receiving bupropion, consider initiating the coadministered drug at the lower end of the dose range. Conversely, if bupropion is added to a regimen containing a drug metabolized by CYP2D6, consider decreasing the dose of the original medication; especially for those concomitant medications with a narrow therapeutic index.

■ MAO (monoamine oxidase) inhibitors: Wait 14 days after discontinuing before starting therapy with bupropion.

■ Although the recommended duration of treatment is 7-12 weeks, bupropion is approved for use up to six months to prevent relapse to smoking.22

■ Bupropion may be associated with less weight gain.

■ Bupropion may be used in combination with the nicotine patch.6,23

**Bupropion Safety**24-26

Bupropion is associated with a dose-dependent risk of seizures; maximum bupropion SR dose for treating smoking is 300 mg/day. Although higher doses of bupropion SR have been used for treating depression, they have not been
tested for smoking cessation. Also, there is no evidence that higher doses improve quit rates.

Extreme caution is advised in patients with severe hepatic cirrhosis; all patients with hepatic impairment should be closely monitored for possible adverse effects. Caution is also advised in patients with a history of hypertension, myocardial infarction, or unstable heart disease due to risk of hypertension.

Serious neuropsychiatric symptoms have been reported in patients taking bupropion for smoking cessation. These symptoms include, but are not limited to depression, suicidal ideation and suicide attempt. The Food and Drug Administration (FDA) has provided the following recommendations for monitoring bupropion when used for tobacco cessation:

- **It is important to discuss the possibility of serious neuropsychiatric symptoms in the context of the benefits of quitting smoking with patients before prescribing bupropion.** *Bupropion is an effective smoking cessation aid and the health benefits of smoking cessation are immediate and substantial.*

- **Healthcare professionals should monitor all patients taking bupropion for serious neuropsychiatric symptoms.** These symptoms include changes in behavior, hostility, agitation, depressed mood, suicidal ideation, suicidal behavior, and attempted suicide. These symptoms have occurred in patients without pre-existing psychiatric illness and have worsened in some patients with pre-existing psychiatric illness. In most cases, neuropsychiatric symptoms developed during treatment with bupropion but in others, symptoms developed after stopping drug treatment.

- **Patients should be informed that it is not unusual to have symptoms such as irritability, feeling anxious, depressed mood and trouble sleeping when they are withdrawing from nicotine, independent of whether they are taking bupropion.**

- **Patients with serious psychiatric illness such as schizophrenia, bipolar disorder, and major depressive disorder, may experience worsening of their pre-existing psychiatric illness while taking bupropion.**

- **Patients who discontinue treatment because of neuropsychiatric events should continue to be monitored until symptoms resolve.** Although in many cases symptoms resolved after treatment was stopped, there were some cases where the symptoms persisted.
Varenicline is a partial agonist that binds selectively to the α4β2 subunit of the nicotinic acetylcholine receptor thereby reducing the symptoms of nicotine withdrawal during abstinence. Because of the significantly higher affinity of varenicline for the α4β2 receptor subunit, it blocks nicotine from binding to the receptor and attenuates the reinforcement and rewarding effects of nicotine.

- Peak concentrations occur within 3-4 hours after oral administration. Steady-state conditions are reached within four days. Varenicline is well absorbed and levels are unaffected by food or time-of-day dosing. However, recommend to patients that they take it after eating and drink eight ounces of water in order to minimize nausea.

- Primarily eliminated via glomerular filtration with active tubular secretion. In subjects with decreased renal function, varenicline exposure increased from 1.5 to 2.7-fold compared with subjects with normal renal function. Varenicline is efficiently removed by hemodialysis.

- Dosage adjustment is necessary for patients with estimated creatinine clearance <30 ml/min.

- No clinically significant drug interactions.

- For patients who have successfully stopped smoking at the end of 12 weeks, an additional 12-week course of treatment (for a total of 24 weeks) may be beneficial in maintaining and increasing the likelihood of long-term abstinence and preventing relapse.

- To date, the safety and efficacy of varenicline in conjunction with NRT or bupropion for smoking cessation has not been studied extensively and is not recommended.

Varenicline for Tobacco Cessation in VA

Within VA, varenicline is a second-line agent for tobacco cessation and must be prescribed according to Pharmacy Benefit Management (PBM) criteria, which can be found on the PBM website (https://vaww.cmopnational.va.gov/cmop/PBM/Clinical%20Guidance/Criteria%20For%20Use/Varenicline%20Criteria%20for%20Prescribing.doc).
suicidal thoughts and behaviors, and attempted suicide. All patients should be monitored closely and advised to stop treatment if any of these symptoms appear.

Health care providers should perform a careful psychiatric history prior to prescribing the drug and avoid use in smokers with a history of suicidal ideation or a current unstable psychiatric condition. Consider a temporary or permanent dose reduction in patients who cannot tolerate the adverse effects of varenicline.

Varenicline may be associated with a small, increased risk of certain cardiovascular adverse events in patients who have cardiovascular disease. Cardiovascular adverse events were infrequent overall, however, certain cardiovascular adverse events were reported in more patients treated with varenicline than patients treated with placebo. The FDA is continuing to evaluate the cardiovascular safety of varenicline.

### IV. Medications for Tobacco Cessation

#### BUPROPION

- **Advantages (+)** and disadvantages (-) (cont.)
  - Consistent rate of exposure; helps with withdrawal symptoms
  - (-) Many drug interactions; CNS side effects; must be adjusted for hepatic insufficiency; increased risk of seizures

- **Adverse effects**
  - Agitation
  - Anxiety
  - Dizziness
  - Headache
  - Insomnia
  - Constipation
  - Dry mouth
  - Nausea
  - Hypersensitivity reactions
  - Seizures (risk 1:1000)

#### NICOTINE TRANSDERMAL PATCH

- **Advantages (+)** and disadvantages (-)
  - Unobtrusive; can be combined as needed with gum, lozenge, or bupropion for better efficacy
  - (-) Less effective for cravings; difficult to control titration; absorption increased at elevated temperatures

- **Adverse effects**
  - Sleep disturbances
  - Local skin irritation
  - Bone pain
  - Headache
  - Nausea

#### NICOTINE POLACRILEX GUM

- **Advantages (+)** and disadvantages (-)
  - Combined with nicotine patch or bupropion for better efficacy
  - (-) Difficult for those with poor dentition or dentures; must use proper chewing technique; must abstain from drinking and eating during gum use; swallowing the nicotine causes GI side effects

- **Adverse effects**
  - Local mouth irritation
  - Jaw pain
  - Hiccups
  - Dyspepsia
  - Rhinitis
  - Nausea
  - Flatulence

#### NICOTINE POLACRILEX LOZENGE

- **Advantages (+)** and disadvantages (-)
  - Titrate to adjust for cravings; reduces self-reported withdrawal symptoms; can be combined with nicotine patch or bupropion for better efficacy
  - (-) Must abstain from drinking/eating during lozenge use

- **Adverse effects**
  - Local mouth irritation and tingling
  - Heartburn, indigestion (if chewed)
  - Headache
  - Nausea, diarrhea
  - Flatulence

#### VARENICLINE

- **Advantages (+)** and disadvantages (-)
  - Abstinence compared to bupropion and placebo
  - (-) Potential for serious neurologic and psychiatric side effects (esp. in those with underlying psychiatric disease); dose adjust for renal insufficiency (CrCl<30); high incidence of nausea

- **Adverse effects**
  - Dream disorders
  - Headache
  - Insomnia
  - Agitation
  - Depressed mood
  - Suicidal thoughts
  - Constipation
  - Flatulence
  - Nausea and vomiting

*Consider dose reduction in patients with nausea, insomnia, headache*

**Contraindications & relative contraindications**

- **Contraindications:**
  - History of seizures
  - Predisposition to seizures (severe head trauma, CNS tumor, hepatic cirrhosis)
  - Abrupt withdrawal from heavy alcohol or sedative use

- **Relative Contraindications:**
  - Hypersensitivity
  - Pregnancy category D
  - Use within 14 days post MI, or serious or worsening angina
  - Patients should be encouraged to avoid smoking while on nicotine replacement therapy. If the patient has a slip, encourage them to get back on track and consider using combination therapy if on monotherapy. If patient has a relapse, then suggest patient stop using NRT and restart once they are ready to try quitting again.

- **Contraindications:**
  - Serious neuropsychiatric disorders (including suicidal and homicidal ideation)
  - History of suicidal, homicidal, or assaultive behavior in the past 12 weeks

IV. Medications for Tobacco Cessation

This page intentionally left blank.
V. Relapse Prevention and Tobacco Cessation Maintenance
This page intentionally left blank.
CHAPTER SUMMARY

- Tobacco use is a chronic, relapsing disorder
- Multiple quit attempts and interventions may be necessary
- Relapse is NOT uncommon
- Continue to address tobacco use status at every visit and provide ongoing support
- Offer retreatment with medication and counseling
- Provide patients with options for the management of withdrawal symptoms

TOBACCO USE: A CHRONIC, RELAPSING DISORDER

Patients who have recently quit using tobacco are at very high risk for relapse. Relapse is more likely to occur early in the process of quitting, but it can also occur months or years later. While there have been numerous studies attempting to identify strategies or interventions that are effective to prevent relapse, these studies have failed to identify specific interventions that are effective. The most effective strategy to prevent relapse appears to be use of an evidence-based tobacco cessation treatment from the start, including a combination of tobacco cessation medications and behavioral counseling, as described in previous chapters.

For patients who have recently quit using tobacco, continue to provide support at each visit, especially if they express concerns about relapse. Patients should receive reinforcement for their decision to quit, be congratulated on their success at quitting, and encouraged to remain abstinent. Ask open-ended questions about noticeable benefits they have experienced since quitting. It may be helpful to talk with patients about previous quit attempts and encourage them to plan for how they will cope with challenges to quitting.

Encourage patients to identify their sources of support and if needed, refer them to a counselor or tobacco cessation program for additional support. Additional support available from VA is summarized on the VA Tobacco & Health webpage (www.publichealth.va.gov/smoking). Other resources include the VA telephone quitline, which can be reached at 1-855-QUIT VET (1-855-784-8838) M-F, 8 am-10 pm, ET (counseling is also available in Spanish), and the SmokefreeVET text support program (text the word VET to 47848 or sign up at www.smokefree.gov/VET).
MANAGEMENT OF WITHDRAWAL SYMPTOMS

For patients who relapse, encourage them to describe the challenges they encountered during their quit attempt and recommit to another quit attempt. If needed, also consider referring them to a more intensive smoking cessation treatment program. If the previous quit attempt included medication, review whether the patient used it in an effective manner and determine whether the medication was helpful. Based on this assessment, retreatment can be recommended with either the same medication or with combination NRT.²

Those who relapse often report problems that have been worsened by smoking withdrawal. These may include depression, weight gain, or withdrawal symptoms. If a patient reports prolonged cravings or other withdrawal symptoms, consider using combination therapy or extending the use of a short-acting medication (such as the gum or lozenge) to be used on an as-needed basis when acute withdrawal symptoms and urges to use cigarettes occur.¹

Please refer to the table below for guidance on counseling patients about specific withdrawal symptoms commonly associated with quitting tobacco.

</tr>
</tbody>
</table>

Delay: The most important thing to remember is that an urge will go away if you just give it time. Waiting out an urge, especially if you begin to do something else, is easier than you may expect.
Cravings/ urges (nicotine withdrawal/ habit) (cont.)

Believe it or not, the urge will fade after 5 to 10 minutes, even if you do not smoke. It also helps if you have a positive attitude about the urge disappearing. Think “this won’t last, the urge will go away,” or “I would like a cigarette, but I’m not going to have one, because I don’t need one.”

**Escape:** Another technique for dealing with an urge is to remove yourself from the situation or event which led to the urge. If you’re in a room where others are smoking, and an urge hits, get up and take a short walk. You can walk around the building, or outside, until you feel ready to re-enter the situation--without smoking.

**Avoid:** Avoiding situations where you’ll be tempted to smoke will be particularly important in the first days and weeks after you quit. For example, if you regularly go to places where there’s a lot of smoking, like coffee shops or clubs, it’s best to avoid them for a little while to allow you to get used to not smoking.

**Distract:** Another way to control urges is to get busy, get back to what you were doing before the urge hit. Also, there may be other things you enjoy doing that are incompatible with smoking such as working in the yard, reading a magazine, walking, taking a shower, or working a crossword puzzle.

**Substitute:** When you feel that you want a cigarette, substitute something else for a cigarette. We suggest sugar-free candy or sugar-free gum, especially if you are watching your weight. You could eat a piece of fruit or drink a soft drink. You can also use something to chew on like a straw or a toothpick. The trick is to come up with something you like that can be easily substituted for a cigarette.

VI. Establishing A Tobacco Cessation Program In Primary Care Clinics

CHAPTER SUMMARY

Group counseling program

- Class 1: Introduction
- Class 2: Why do I use tobacco and nicotine addiction
- Class 3: Medications to help you quit tobacco and getting ready for quit day
- Class 4: Quit day
- Class 5-7: Follow-up classes

GROUP COUNSELING PROGRAM

This chapter offers suggestions on how to moderate a tobacco cessation group counseling program using the guidance below and My Tobacco Cessation Workbook: A Resource for Veterans. The participant manual is designed to be used in a group format for patients in primary care clinics. The program is flexible when choosing which chapters to use in each group session. To encourage an environment that supports motivational interviewing, topics for discussion can be introduced at the beginning of each session. The class can then have input on the topics they would like emphasized. Classes should be instructed in a format that encourages discussion among the group members. Participants have the opportunity to choose the topics they would like to focus on for the session. Group moderators should feel free to incorporate these suggestions or make changes that they find appropriate. However, providers should ensure that changes to the program follow the guidelines provided in the 2008 U.S. Public Health Service Clinical Practice Guideline Treating Tobacco Use and Dependence.

It is recommended that the group program consist of 5-7 classes, each lasting 60 minutes in duration. The program could be extended to 8-10 classes to allow coverage of all topics in adequate detail and to have a longer follow-up period.

Additional classes can be added to allow group support for the first few months after quit day. The duration of follow-up classes can be extended for a longer period of time if the instructor feels this is necessary. Another consideration for follow up could be to do telephone follow up at one month and two months after quit day and potentially adding follow up at six and 12 months to evaluate long-term cessation.

A more detailed look at the classes is reviewed below.

**Class 1**

Covers Chapter 1: Introduction

**Room Set Up**

This group program would be best delivered in a room with chairs arranged in a circle. A dry erase board is useful when having a group discussion to write down ideas from the group.

At the beginning of the session, take time to do introductions and give some background into what participants can expect from the program. Introduce yourself to the group and include your experience in providing tobacco...
cessation counseling. Discuss if you have smoked in the past and if so, how you quit tobacco. If you have never smoked cigarettes, you are still able to moderate this program. Just be honest with the group and let them know that you will be providing information and counseling that is based on strong evidence to help people quit tobacco. *If you are currently a tobacco user, it is advised that you not be an instructor for this group.*

**Background For Providing Tobacco Cessation Counseling**

Review with participants that research has shown that providing tobacco cessation counseling in addition to medications for tobacco cessation is the most effective way to help people quit smoking. While the research is not as strong for the use of tobacco cessation counseling and medication for people who use chewing tobacco, cigars or pipes, it is felt that these measures may still help people quit. The program can be used by all types of tobacco users. Discuss that on average, it takes 6-8 tries for people to quit tobacco. It is important to highlight that participants should not be frustrated if they have tried to quit in the past and have not been successful. Each time a person tries to quit tobacco they learn a little more about how to quit. These lessons can be applied in future quit attempts. Review that tobacco use can be thought of as a chronic disease like hypertension or diabetes and that tobacco users can rotate between using tobacco and not using tobacco many times before they quit for good.

Next, have the group introduce themselves and state what type of tobacco they use, how much daily, and when they started using tobacco. This information is good to enter into your progress notes for the class. Note if participants are using chewing tobacco. If participants are using chewing tobacco, try to say “tobacco” rather than “cigarettes” when instructing the program so everyone feels included.

It is a good idea to set up “rules” for the program. Examples include respecting other group participants, keeping information that is said in the group confidential, no tobacco breaks during class, and limiting topics of discussion to tobacco cessation. It is beneficial to keep political talk out of the group sessions. Also ask the group for rules they would like to include. Participants can sign confidentiality agreements at the first class to be scanned into their charts.

**Give A Brief Summary Of The Program, Reviewing The Topics For Discussion For Each Of The Classes**

A discussion about the regional tobacco use for the state where you live is a good way to start participants talking in the group. You can find your state-
specific prevalence of cigarette and smokeless tobacco use on the Centers for Disease Control and Prevention (CDC) website at: http://www.cdc.gov/tobacco/data_statistics/state_data/index.htm. The prevalence of tobacco use among VA patients is very similar to the state-specific data, but in some cases might be slightly higher.

The next topic of discussion is the participants’ reasons to quit tobacco. Explain that it is important to start thinking about why they want to quit and to keep these reasons at the forefront of their minds as they embark on this quit attempt. Ask the participants to give one reason they have for quitting tobacco to facilitate a discussion. If participants offer “my health” as a reason, ask them to be specific about what part of their health they are concerned about and list each health reason separately. Being specific about health reasons will make it more personalized for the group members.

Ask participants to review why they use tobacco. Again have them go around the room and give one reason they use tobacco. Reassure participants that it is ok to admit that they like to smoke or chew (or both) and this does not impact whether they will be successful in stopping tobacco. Once they have reviewed their reasons to use tobacco, have them look at the participant manual pages (p. 3-4) listing their reasons to quit and their reasons to use tobacco. Ask: Do your reasons to quit outweigh your reasons to continue to use tobacco? If the answer is yes, then they are ready to quit tobacco.

Next, ask the participants if they have tried to quit tobacco in the past. Then have them think about what caused them to go back to using tobacco. Introduce this as a barrier to quitting. Barriers can be thought of as “speed bumps” that can get in the way of quitting successfully. The barriers can also become a “back door” that is left open to justify going back to smoking or chewing. It is helpful to close these “back doors” so there is no reason to return to tobacco. Have the class give one barrier they feel might hinder their chances of quitting tobacco. Participants can mark off their barriers to quitting on page 5 of the participant manual. Discuss each barrier and have the group think of ways to manage each barrier without using tobacco.

Class 2

Covers Chapter 2: Why Do I Use Tobacco? & Chapter 3: Nicotine Addiction

Why Do I Use Tobacco?

Review the types of behaviors related to tobacco use:

1. Learned behavior: Ask the class where they learned to use tobacco. The list could include family, friends, TV/movies, magazines, and
military life. Then go over the calculation of how often they puff on a cigarette a day and mention how many puffs this would equal in a year.

If you look at smoking one pack a day for 40 years you would have taken approximately three million puffs from cigarettes.

<table>
<thead>
<tr>
<th>Example</th>
<th>My Experience</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you smoke 1 pack per day</td>
<td>□ I smoke ____ packs/cigarettes per day</td>
</tr>
<tr>
<td>Estimate 10 puffs on each cigarette</td>
<td>□ Estimate 10 puffs on each cigarette</td>
</tr>
<tr>
<td>10 puffs/cigarette x 20 cigarettes/day = 200 puffs each day</td>
<td></td>
</tr>
<tr>
<td>200 puffs/day x 365 days/year = 73,000 puffs/year</td>
<td>□ 10 puffs/cigarette x ____ cigarettes/day = ____ puffs each day</td>
</tr>
</tbody>
</table>

2. **Triggered behavior**: Have the class discuss their triggers and have them mark these off in the participant manual (p. 8-9). Then pose a challenge: Ask each participant to pick one trigger they have each day. An example of a trigger could be after breakfast. The challenge is to avoid smoking or chewing tobacco for 10 minutes after that trigger for the first day. If they are successful in waiting 10 minutes, then they are encouraged to add 10 minutes a day until they have reached not smoking for 60 minutes after the trigger. They should only attempt one trigger once in a day to start. If they are successful with the first trigger, then the next week they can try a new trigger. Have participants think of things they can do instead of smoking. Examples could be taking a walk, deep breathing, using sugar-free candy or gum, chewing on a straw or toothpick, reading a book, doing yard work, or brushing their teeth. This can help them be more successful at avoiding using tobacco use around the trigger.

3. **Automatic behavior**: Review that tobacco use can develop over time into an automatic behavior where they use tobacco without even thinking about it. To help reduce the automatic behavior, suggest they move their tobacco to a different location. This could mean putting the pack of cigarettes on the kitchen counter instead of in their pocket. They could also bring only one cigarette with
them when going outside to smoke instead of the entire pack. This way they have to go back inside to get more if they want more than one cigarette. This may help them reduce the amount of daily use. The other tip is to try using *Table 2. Tobacco Tracker* (p. 13) of the participant manual. For this exercise, participants mark off each cigarette they smoke or each time they chew, noting their mood before using tobacco and their need for the tobacco. They can mark off $\frac{1}{2}$ cigarettes, if they are smoking only $\frac{1}{2}$ of the cigarette at a time. By writing down each time they use tobacco, it can help them see patterns in their use and whether they smoke due to emotional changes or from boredom. They may also find that they can put off having a cigarette for a while and this may help reduce their daily consumption.

*Nicotine Addiction*

Nicotine is a substance found naturally in tobacco that causes feelings of pleasure, relaxation or stimulation, and stress reduction. Many people mistakenly think that nicotine is the substance that causes cancer, lung disease and the other toxicities related to tobacco use. Explain that the body is harmed by the many other substances found in tobacco and those compounds are formed when they are burned. Advise that tobacco, even when grown organically and harvested and dried without chemicals, is harmful to the body and still contains cancer-causing substances. There are more than 7,000 chemicals in tobacco smoke that cause cell damage, cell death, and cancer. Some of the compounds that are harmful to humans include:

- Carbon monoxide
- Hydrogen cyanide
- Ammonia
- Lead
- Cadmium
- Polonium-210
- Arsenic
- Benzene
- Formaldehyde

Nicotine is one of the most addictive substances available on earth; this is why it is so hard to stop smoking. Explain that you feel a need for a cigarette when
the level of nicotine in your body starts to drop. If you go for long periods of time between cigarettes or after sleeping during the night without cigarettes, you will have a strong craving to smoke. This is because the amount of nicotine in your body has dropped and since your body is used to having nicotine, it will want more.

Now ask class participants if they have tried to quit tobacco in the past and what withdrawal symptoms they have experienced. Some common withdrawal symptoms include:

- Irritability/frustration/anger
- Anxiety
- Difficulty concentrating
- Restlessness
- Depressed mood
- Difficulty sleeping
- Increased appetite
- Cravings
- Coughing
- Runny nose

Explain that most of these symptoms start on the first or second day after stopping tobacco. They are at the worst in the first week and get better with time. Most symptoms will disappear after 2-4 weeks. Irritability and difficulty sleeping will usually be gone after 2-4 weeks, but the urge to smoke can stay for a long time. The urge will be stronger at first and seem to last for minutes. However, after the first 2-4 weeks, the urges become shorter. For most people the urge lasts only seconds after they have been off tobacco for a month or longer. Nicotine withdrawal symptoms can be managed by some medicines and with behavioral coping strategies. Medications to help with tobacco cessation will be discussed during Class 3.
VI. Establishing A Tobacco Cessation Program In Primary Care Clinics

Here are some suggestions to deal with the withdrawal symptoms:

VI. Establishing A Tobacco Cessation Program In Primary Care Clinics

**Withdrawal Symptom**  
- Craving/urge for tobacco  

**Recommendation**  
- Practice **DEADS Strategy** (see p. 47 of participant manual)  
- Use nicotine replacement therapy

Administer the Fagerström Test for Nicotine Dependence, go over the questions with the group, and have them discuss some of their answers.

<table>
<thead>
<tr>
<th>Fagerström Test for Nicotine Dependence</th>
<th>Points*</th>
<th>Your Points</th>
</tr>
</thead>
</table>
| 1. How soon after you wake up do you smoke/use your first cigarette/chew? | Less than 5 min. 3  
6-30 min. 2  
31-60 min. 1  
After 1 hr. 0 | | |
| 2. Do you smoke/chew more frequently in the hours after waking than during the rest of the day? | Yes 1  
No 0 | | |
| 3. Do you find it difficult not to smoke/chew? | Yes 1  
No 0 | | |
| 4. Which cigarette/chew would be the hardest to give up? | First one in the morning 1  
Any other 0 | | |
| 5. How many cigarettes do you smoke in a day? | 10 or less 0  
11-20 1  
21-30 2  
31 or more 3 | | |
| 6. Do you smoke when you’re so sick that you’re home in bed? | Yes 1  
No 0 | | |
**VICINE DEPENDENCE SCORE (Points):**

- (0-2 pts.) Very low dependence
- (3-4 pts.) Low dependence
- (5 pts.) Medium dependence
- (6-7 pts.) High dependence
- (8-10 pts.) Very high dependence

Explain what their scores mean. The higher the number (up to 10) suggests a higher level of nicotine addiction. In the end, whether the score is high or low, quitting tobacco will still require hard work.

*How Tobacco Affects Your Body*

Review with participants how tobacco affects the body, starting from the head and going to the toes. To encourage class participation, write each body part (e.g., head) on a board and ask the class the effect of tobacco on each of the parts.

**Head**

- Stroke (blockage or breaking of a blood vessel in the brain)
- Mouth and throat cancers
- Cavities and loss of teeth
- Bad breath
- Decreased night vision
- Yellow staining of skin and teeth
- Nose congestion and infections
- Wrinkles
Lungs
- Cancer (up to 85% of all lung cancers are from smoking)
- Emphysema and chronic bronchitis
- Worsening of asthma
- Lung infections

Heart
- Congestive heart failure
- Heart attacks
- Increased blood pressure and heart rate

Stomach/intestines
- Cancers
- Ulcers
- Heartburn

Pancreas
- Cancer

Circulation in arms, legs and feet
- Reduced circulation in arms, legs and feet that sometimes leads to amputations in severe cases

Bones
- Increased bone thinning leading to a higher risk of broken bones

Genitals/urinary system
- Cancers in kidneys, bladder and reproductive organs
- Erectile dysfunction in men
- Sexual dysfunction in women
Secondhand Smoke

Review the effects of secondhand smoke on adults, children, and pets.

Adults exposed to secondhand smoke may:
- Have more breathing problems
- Get colds or flu more easily
- Have higher chances of heart disease and cancer
- Die younger than people not exposed to secondhand smoke

Children exposed to secondhand smoke may have:
- More breathing problems like asthma
- More ear infections
- More lung infections like pneumonia
- More dental problems like cavities

Pregnant women and infants exposed to secondhand smoke may have:
- A higher risk of giving birth to a low birth-weight baby
- A higher risk of sudden infant death syndrome (SIDS)

Pets exposed to secondhand smoke may have:
- Higher risk of oral cancer, lung cancer and lymphomas (cats)
- Higher risk of lung and nasal cancers (dogs)
- Higher risk of lung cancer (birds)
- A fatal nicotine overdose if your pet eats a cigarette

After reviewing the harmful effects of tobacco, it is time to review how the body heals after stopping tobacco. Review the section Recovery Of Your Body After Stopping Tobacco (p. 26-27) in the participant’s manual. Start with 20 minutes after stopping and end at 20 years. It can be mentioned that the benefits of lowered blood pressure and heart rate occurring 20 minutes after quitting can be experienced by participants as they sit in the group.

20 minutes after you quit
Reduction in your heart rate and blood pressure; the temperature of your hands and feet will start returning to normal.
12 hours after you quit
Carbon monoxide level in your blood drops.

24 hours after you quit
Anxiety and irritability may start due to withdrawal from nicotine. These symptoms get better the longer you are off tobacco.

2–3 days after you quit
Nerve endings in your body start to regenerate and you may notice a return in your taste and smell. Anger, anxiety and irritability from nicotine withdrawal may be at the worst level during this time. Nicotine replacement with nicotine gum or lozenges may help this. Breathing may be easier now.

1 week after you quit
Tobacco cravings and urges may be less frequent and shorter in duration.

2 weeks after you quit
Blood circulation in your gums and teeth are similar to a nonsmoker. You should no longer have anger, anxiety and irritability from nicotine withdrawal. Cravings and urges should be shorter and less frequent.

1–3 months after you quit
Your heart attack risk has started to drop and your lung function is improving. The blood circulation in your body has improved and walking might be easier. Give walking a try and see if you can go farther than when you were smoking. If you had a cough when you smoked, the cough should be gone now.

1–9 months after you quit
Smoking-related nasal congestion, fatigue, and shortness of breath should be improving. Cilia (little hairs in the lungs, throat and nose) have re-grown in your lungs and can clean your lungs to remove irritants and mucous, and reduce infections.

1 year after you quit
The risk of cardiovascular disease, heart attack, and stroke has dropped to less than half that of a smoker.

10–15 years after you quit
Your risk of having a stroke or heart attack has dropped to a similar rate as a nonsmoker.

Your risk of lung cancer is 30-50% less than a continuing smoker’s risk. Your risk of death from lung cancer is one-half of the risk if you were an average smoker (one pack per day). Your risk of pancreatic cancer is similar to a person who has not smoked and your risk of mouth, throat, and esophageal cancer has reduced significantly.
Your risk of tooth loss has decreased to a rate similar to someone who has never smoked.

20 years after you quit (women)
Your risk of death from smoking-related causes, including cancer and lung disease, is the same as a person who never smoked.

Class 3
Covers Chapter 4: Medications To Help You Quit Tobacco & Chapter 5: Getting Ready For Quit Day!

(Please refer to Chapter IV of this manual for detailed information on medications used for tobacco cessation.)

Medications To Help You Quit Tobacco

When presenting information about medications for tobacco cessation, emphasize to the participants that the medications can help them quit tobacco, but they are not a “magic bullet.” Research shows that using medication, in addition to behavioral counseling is the best method to quit tobacco. It is important to present the medications in an unbiased manner, understanding that each class participant might need to use a different regimen due to their medical history or current medications. If one regimen is highlighted to be significantly more effective than another regimen, then participants will want to use that regimen even if it might not be advisable with their medical history or current medications.

There are many ways to present the medication section to the group. One way to present the information would be to first present NRTs, highlighting the nicotine patch, nicotine gum and nicotine lozenge. Since the nicotine nasal spray and nicotine oral inhaler are not on the VA national formulary, it may not be necessary to present these in the group. The nasal spray and oral inhaler could be introduced to an individual patient if they have had problems tolerating the other NRTs and meet the criteria for nonformulary use. Refer to Table 6. Medications for Tobacco Cessation Available Through the VA National Formulary on p. 47 that covers medications.

The nicotine patch, nicotine gum and nicotine lozenge can be presented to include the following information:

- Directions for use
- Duration of therapy
- Potential adverse effects
VI. Establishing A Tobacco Cessation Program In Primary Care Clinics

Options for combination therapy and instructions on use of combination therapy

Bupropion can be presented next with the following information highlighted:
- Relative contraindications
- General dosing instructions
- Potential adverse effects
- Directions for use
- Duration of therapy
- Options for combination therapy and instructions on use of combination therapy

Varenicline can be presented next with the following information highlighted:
- Relative contraindications
- General dosing instructions
- Potential adverse effects
- Directions for use
- Duration of therapy
- Inform class participants that varenicline is not used in combination therapy

Smoking And Drug Interactions

When a person smokes, they inhale polyaromatic hydrocarbons, which can increase the metabolism of certain medications. Specifically the polyaromatic hydrocarbons cause an induction of the CYP1A2 liver enzymes. This effect is only seen with smoking tobacco and is not seen when using chewing tobacco or when using NRT.

Medications that can be affected by this include:
- Atypical antipsychotics
- Theophylline
- Warfarin
- Anxiolytics
VI. Establishing A Tobacco Cessation Program In Primary Care Clinics

- Antihypertensives
- Caffeine

When an individual stops smoking, their liver enzymes will return to normal functioning in 2-3 days. If they are taking the medications listed above, they might have increased adverse effects. If this occurs, a reduction in the medication dose may be needed.

If patients drink coffee or consume other caffeinated beverages, they might have side effects of too much caffeine if they continue their same level of consumption. It is recommended that a person reduce their caffeine consumption by 50% when they stop smoking.

Getting Ready For Quit Day!

With the group, review the following steps to get ready for quit day.

1. Plan out your tobacco usage so you will run out by your quit day. Make sure you remove all tobacco from your home. Look in jacket pockets, kitchen drawers, the freezer, your garage, or other frequent tobacco storage sites. Also check inside your car for any stashes of tobacco. Considering that the average craving for tobacco lasts 2-3 minutes, removing nearby tobacco products will keep you from being tempted. For most folks, the urge may pass before you can get in the car and go to a store to buy tobacco.

2. Remove all ashtrays and lighters. These can be triggers for tobacco once you get to quit day. Since your plan is to quit, do you really still need them? Remove ashtrays and lighters in the car as well.

3. Clean up your smoking area. If you smoke in one room (e.g., porch, garage) or in the car, clean up these locations, as they can be triggers for you to smoke. Remove cigarette butts, wash down furniture, and spray upholstery with an odor neutralizer to help remove the smoke smell. Getting your car cleaned or detailed may help. You may find you have trouble spending time in these areas for a while. That is ok, just take a break and come back when you have a few weeks being tobacco free.

4. Go to the store and stock up on tobacco substitutes. Sugar-free gum, sugar-free mints or candies, carrot and celery sticks or other vegetables, toothpicks, straws, and cinnamon sticks. These items can be helpful to use when you are having a craving.
5. Think about hobbies or other interests you have to fill up your day. Some hobbies/interests to consider would be puzzles, games, reading, exercise, fishing, woodworking, painting, drawing, and cooking. Make sure it is a hobby not associated with tobacco use.

Encourage participants to consider packing an emergency kit for their first long car trip or a pending adventure. Such a kit would contain:

- Sugar-free candy
- Sugar-free gum
- Toothpicks
- Straws
- Vegetables and fruit
- Water
- Cinnamon sticks
- Throat lozenges

Planning For Quit Day

Group Activity

Page 45 of the participant manual has participants list the top situations where they use tobacco and what they will do instead of using tobacco. They can also use the information from Table 2, Tobacco Tracker (p. 13) to review their pattern of using tobacco. Then pick three times that they use tobacco and write these into the spaces on page 45. Ask the group to write down an activity they can do or a substitute they can use instead of using tobacco. Have the group share one of their times that they smoke/chew and something they will do at that time instead of using tobacco.

Stress And Tobacco Use

Most Veterans who use tobacco say that stress is their biggest trigger. When under stress, many smokers will inhale deeper and hold the smoke in longer. Most people feel that using tobacco helps them relax when they are feeling stress. It is important to explain that the feeling of relaxation is usually from the nicotine treating the withdrawal symptoms between cigarettes or chewing tobacco. Nicotine is actually a stimulant and can increase heart rate and blood pressure very quickly. This can result in physical stress.
Ask the group to think about situations that cause them to have more stress. They can write down these situations in their manual.

Discuss with the group the stress reduction tips listed in the participant manual including:

- Talking to a friend
- Deep breathing
- Going for a walk or a jog
- Doing chair exercises
- Reading a book
- Listening to relaxing music
- Working a crossword puzzle
- Playing computer games

**Cravings For Tobacco**

Review that it is common to have cravings for tobacco after quit day. Almost all people have tobacco cravings when they quit. Explain that having a craving for tobacco should never be thought of as a relapse.

Introduce the *DEADS Strategy* (see p.60-61):

- **Delay**
- **Escape**
- **Avoid**
- **Distract**
- **Substitute**

**Get Help From Family And Friends**

Finding a support person can be helpful. It could be a family member, a friend, a neighbor, or someone from work. It is best to choose someone who does not smoke. How can your support person help you?

- Listen when you want to talk
VI. Establishing A Tobacco Cessation Program In Primary Care Clinics

- Call to see how you are doing
- Offer to help you with chores, errands, childcare, shopping, etc.
- Talk about problems and how to solve them
- Cheer you on

You can help your support person in the following ways:
- Let them know what will help you
- Let them know when you will be quitting tobacco
- Plan on when you want to talk to them after quit day
- Plan fun activities that can keep you from thinking about tobacco
- Teach your support person about quitting tobacco, especially if they have not used tobacco themselves
- If you are keeping your quit attempt a secret, then let your support person know this
- Thank your support person for helping you quit tobacco

Class 4
Covers Chapter 6: Quit Day

Quit Day

Celebrate the quit day! Congratulate everyone in class for making it to this day. Take time to go around the group and ask everyone when they last smoked or chewed tobacco. Congratulate those who have quit so far and give encouragement to those who have not quit. Provide assistance to those who have not yet quit. Review briefly getting ready for quit day again and suggest they try quitting tomorrow if they are ready.

Review The Following:

It Is Time To Make Some Changes:
- Change your routine
- Switch the order of your morning
- Be active — take a walk
- Have your morning coffee in a new mug
VI. Establishing A Tobacco Cessation Program In Primary Care Clinics

- Drink less caffeine
- Drive to work on a new route
- Take your work break inside
- Get up from the table as soon as you finish eating
- Sit in a different chair to watch TV or read the newspaper

**Keep Busy:**
- Do something fun like see a movie
- Exercise for 20-30 minutes a day
- Wash your clothes and sheets
- Use substitutes to keep your mouth busy
- Meet with friends who don’t smoke
- Go to nonsmoking places like the library
- Drink more water
- Stay away from places where you smoked

**Don’t:**
- Feel like smoking has been taken away from you, remember you are better off without it.
- Test yourself by trying a cigarette. This can lead to a full relapse.
- Forget there will be difficult times when you stop smoking: be proud of how well you are doing!
- Drink alcohol and go to bars for a while; this can be too tempting and you may want to smoke.
- Forget to bring nicotine lozenges or nicotine gum with you when you need to go places or do things where you used to smoke.

**Handling Nicotine Cravings**

Review that nicotine cravings at first seem like they last minutes and happen frequently. The cravings will reduce in intensity and frequency with more time off tobacco. Review the *DEADS Strategy* (p. 60-61). Also remind participants
that have been using nicotine gum or lozenges in combination therapy that these are used to help reduce nicotine cravings.

Spend a few minutes reviewing deep breathing exercises and suggest using these to help with nicotine cravings.

Discuss how exercise can be used to help reduce nicotine cravings. For participants who do not currently exercise, emphasize that they start very slowly at about five minutes and slowly increase as tolerated. Review activities they can try:

- Walking or jogging
- Tennis
- Dancing
- Golfing without a cart
- Aerobic exercise classes
- Cycling
- Gardening and pushing a lawn mower
- Yoga
- Swimming
- Water walking
- Weight machines
- Aqua aerobics

Healthy Eating

This can be particularly helpful if participants are concerned about weight gain after quitting tobacco.

Suggestions to review:

- Weight gain is typically small from quitting tobacco, about 5-10 pounds on average.
- Eating more healthy foods and staying active can minimize weight gain after stopping tobacco.
Eat more fresh fruits and vegetables. If you cannot afford fresh fruit/vegetables, then try buying them frozen.

Drink more water, which will help you feel full and reduce weight gain.

Eat carrot and celery sticks to help with the hand-to-mouth habit from smoking.

Eat crunchy foods like pretzels, rice cakes, or air popped popcorn, so your mouth has to work.

If craving a sweet, eat a small square of dark chocolate or a low-fat frozen yogurt.

Eat smaller meals, but more often. If you eat snacks in between meals, you are less likely to overeat. This can help prevent weight gain as well.

Congratulate the class one more time to finish the session and wish them luck for the next week.

Classes 5-7: Follow-up classes

Covers Chapter 7: The first two weeks after quit day, Chapter 8: How do I stay off tobacco? & Chapter 9: Living as a nonsmoker)

The ideal time for the first follow-up class is in the first week after quit day. Subsequent follow-up classes can be done weekly or could be extended to every two weeks.

The First Two Weeks After Quit Day

The first portion of each follow-up class can be used to ask each class member to share how they have done since quit day. Ask the class to comment on the following:

- Have you had any slips since quit day?
  - If you had a slip, what caused it?
  - Did you continue to smoke or did you stop after the slip?
  - What could you do in the future to prevent having a slip?

- What benefits have you noticed since quit day?
  - Examples of some benefits they may have noticed so far:
    - Improved breathing
VI. Establishing A Tobacco Cessation Program In Primary Care Clinics

- More energy
- Improved sense of taste and smell
- Yellow staining almost gone from fingers and sides of mouth
- Feeling in control instead of the cigarette being in control
- MORE MONEY!

Reward Yourself

Discuss that rewarding yourself along the way when you quit tobacco can help you stay motivated. Review examples of rewards:

- Buy yourself something special to celebrate quitting
- Splurge on a massage or dinner at a new restaurant
- See a movie or sporting event
- Start a new hobby
- Begin exercising
- Use your savings to pay off your bills
- Go on a nice trip after being a nonsmoker for six months

Ask the group if they have some rewards they plan to do after quit day. Review page 61 of the participant manual and the cost savings from quitting tobacco. Have the group calculate their savings.

If participants have problems with triggers and urges for tobacco, review the section:

How Do I Stay Off Tobacco?

Watch Out For Triggers

- Go back to your list of triggers on pages 8-9.
- What triggers are the most common now that you have quit?
- How have you kept from using tobacco when you have a trigger?
Resist The Urges

Remember, the urge to use tobacco will go away whether you smoke/chew or not. Try to avoid using tobacco and the urges will slowly lose their power over you.

Go back to page 45 when you were planning for quit day. On that page you wrote down what you could do instead of smoking when you had a craving for tobacco. Have these strategies worked?

Make a new list if your strategies are not working.

- Instead of using tobacco I could:
  - Go for a walk
  - Chew gum
  - Eat a sugar-free mint or candy
  - Talk to a friend
  - Listen to music
  - Play with your dog/cat
  - Try deep breathing

_No matter what, don’t think “Just one won’t hurt’”…yes it can hurt and cause you to go back to smoking daily. You have worked so hard!

Keep things simple. Work through this one day at a time.

Planning For The Future

It is time to start looking at your calendar and see if there are any big events coming up that might be a trigger for you to use tobacco. Examples of some events that could cause triggers:

- Weddings
- Holidays
- Anniversaries
- Birthdays
- Family or group events
- Sporting events
VI. Establishing A Tobacco Cessation Program In Primary Care Clinics

- Hunting season
- Fishing season

List some upcoming events where you might be triggered to use tobacco.

What could you do instead of smoking at these events?

**Slip Prevention**

This is an important section to review with participants. Include an explanation of what a slip is and how to prevent slips. Use the information below to assist with the discussion.

**What is a slip?** This is when you smoke a couple cigarettes and then go back to not smoking. This is not a full relapse but can lead to a relapse if not corrected quickly.

**To prevent slips:**

- Be aware of triggers—during these times you will crave tobacco more often
- Do not get overconfident—you may think that you can smoke just one and go back to being a nonsmoker. Many people relapse and go back to full-time smoking after just one cigarette.
- Think about the benefits you have experienced and feel good about your progress

**To continue your success, try to:**

- Be aware of your triggers
- Not get discouraged if you slip and stay the course of becoming tobacco free
- Stay positive and praise your achievements
- Focus on the benefits of quitting and beginning a healthier lifestyle

**What if I have slipped?**

Don’t get discouraged! One cigarette is better than smoking the whole pack. Get back on track quickly.

- Slips can quickly lead to a relapse
If you bought a pack, throw it away and destroy it so you will not be tempted to dig it out of the garbage

Continue to use medications as prescribed

Figure out what caused the slip:

- If you can identify what caused the slip, you can try to prevent this from happening in the future
- If stress is the cause, review your stress reduction strategies such as:
  - Deep breathing
  - Going for a walk
  - Removing yourself from the stressful situation
  - Using nicotine lozenges or nicotine gum if you were prescribed these medications. If you were not prescribed these, ask your provider if these would be appropriate for you.

Don’t let one slip take you back to smoking again!

What if I am back to daily smoking?
If you go back to daily smoking then this is called a relapse. If you relapse, get back on track as soon as you can.

- Stop your medications until you are ready to quit again
- Set a new quit day in the next two weeks
- Review what led you to start smoking again
- Plan out your cigarettes so you will not have any left once you get to your new quit day
- Throw out ashtrays and lighters on quit day
- Talk to your provider about the medication you used for stopping tobacco
  - You might want to consider a change in medication if the medication did not seem to help you or if you had adverse effects from the medication.
  - If the medication did help you, then you can retry the same medication.
Don’t tell yourself negative messages like:

- “It’s no use, I can’t quit. I may as well give up because I smoked!”
  - In reality, it takes people on average 6-8 tries to quit for good.

- “I smoked because I’m weak and don’t have the willpower.”
  - This is not about willpower. It’s more about learning from the relapse to make sure you don’t fall back again. You learn more about your addiction and the best way for you to quit the more times you try.

- “I’m too old to quit smoking; it is too late for me anyway.”
  - Everyone can benefit from stopping smoking no matter their age or current health status.
  - Even people with very severe lung disease can see improvements by stopping smoking.

**Living As A Nonsmoker**

For each follow-up class, go around the room and have each member comment on the progress of their quit attempt. Have each member comment on the following:

- Have you had any slips since quit day?
  - If you had a slip, what caused it?
  - Did you continue to smoke or did you stop after the slip?
  - What could you do in the future to prevent having a slip?

- What benefits have you noticed since quit day?
  - Examples of some benefits they could have noticed so far:
    - Improved breathing
    - More energy
    - Improved sense of taste and smell
    - Yellow staining almost gone from fingers and sides of mouth
    - Feeling in control instead of the cigarette being in control
    - MORE MONEY!

Review with the group tips to maintain cessation from tobacco products. Use the information to assist with the discussion. Congratulate everyone in the
VI. Establishing A Tobacco Cessation Program In Primary Care Clinics

...group on their progress in quitting tobacco. For those who are still smoking, provide continued encouragement to help them quit completely. One strategy is to set another quit day and try again. For those who have quit completely, encourage continued cessation by reviewing the following:

- Avoid smoking and chewing
  - Smoking or chewing even one time can lead to relapse. Sometimes you might think that “it is only one” but many people have relapsed from “just one.”
  - Avoid cigars also, this can lead you back to smoking or chewing and cause a relapse.

- Try to be around people who do not smoke
  - It can be challenging to stay off tobacco when you are around people who still smoke. Try to be around nonsmokers if you can do this. If you must be around people who smoke, let them know you have quit smoking and ask them not to offer you any tobacco. You can also be around them in places where they can’t smoke.
  - Bring your emergency kit and other items to help distract you from wanting to use tobacco.

- Continue to use substitutions and distractions
  - Use your emergency kit or some sugar-free candy or gum
  - Have a book, the newspaper, or a puzzle book to do when you have extra time on your hands

- Don’t be afraid to ask for help
  - If you have been working with your primary care provider or tobacco cessation counselor to quit, contact them if you are struggling to remain off tobacco
  - Ask for help from friends and family
  - Call the tobacco quit line at 1-855-QUIT VET

- If you have been using medication to help you quit, take it for the entire course of treatment
  - You may feel ready to stop the medication early, but try not to do this. The medication may work better if you finish the entire course.
VI. Establishing A Tobacco Cessation Program In Primary Care Clinics

• If you need the medication for a longer period of time, talk to your primary care provider or tobacco cessation counselor.

- Congratulate yourself every day
- You have done an amazing job and you deserve it!

Remind Participants: If you feel like using tobacco again, remember why you quit.

Go back to page 3 and look at your reasons for quitting tobacco. Check off the things you are enjoying now that you have quit tobacco:

- I have more energy
- I can breathe better
- I am not wheezing
- I sleep better
- I can walk farther
- I have saved money
- I don’t have to stand outside to smoke
- I can say I am a nonsmoker
- I am setting a good example for my children/grandchildren
- I smell better
- I can taste my food
- I have lowered my risk of cancer
- I have lowered my risk of heart disease
- I have less stress since I quit tobacco
- I am in control now
- I am proud of myself
Dealing With Stress

Here are more tips on how to deal with stress. We all have stress, so remember that there are ways to deal with stress other than using tobacco.

Do what is best for you

- Give yourself extra time to get to work or appointments
- Make time to do things you want to do
- Learn to say “no” to things you don’t want or don’t have time to do
- Eat healthy foods
- Get enough sleep
- Reward yourself

Have fun

- Enjoy your hobbies
- Go for a walk, go swimming, or get on your bike
- Go to a movie
- Play with your favorite pet
- Go outside

Spend time with others

- Visit or call a friend
- Go out to eat
- Spend time with family members
- Cook a special meal for your spouse or friend
- Go to a fun event

Keep busy

- Go dancing
- Work on your yard
- Fix or build something
VI. Establishing A Tobacco Cessation Program In Primary Care Clinics

- Clean your home
- Listen to music

Find time to relax and have quiet time
- Read a book or magazine
- Listen to music
- Take a bath
- Practice deep breathing
- Meditate
- Daydream
- Take a yoga class
This page intentionally left blank.
Appendices

Appendix A. Evaluating Tobacco Cessation Programs

Appendix B. Tobacco Cessation Resources
Appendix A. Evaluating Tobacco Cessation Programs

To assess the effectiveness of your program, track the outcome measures related to its objectives. The use of these outcome measures as performance measures will elicit more participation support among your fellow clinicians. Below is a list of tobacco cessation program performance measures you may want to track yearly, quarterly, monthly, weekly, and/or daily.

- Number of patients seen in your clinic
- Number of patients identified as a smoker in CPRS (Tobacco Use Disorder ICD-9 Code 305.1)
- Number of patients identified as smoker when prompted by a provider
- Number of patients in each dependence level, as defined by Fagerström Test for Nicotine Dependence
  - (0-2 pts.) Very low dependence
  - (3-4 pts.) Low dependence
  - (5 pts.) Medium dependence
  - (6-7 pts.) High dependence
  - (8-10 pts.) Very high dependence
- Number of patients reporting abstinence (supported by cotinine level, CO₂ – optional)
  - Continuous abstinence (1, 3, 6, and 12 months)
  - 7 day point prevalence (not smoking during the last 7 days)
- Number of patients referred to the smoking cessation program
- Number of encounters/visits completed
- Number of patients enrolled in the clinic
- Number of quit attempts
- Number of patients prescribed the different types of medication regimens and their outcomes (abstinence)
Appendices

- Combination NRTs such as the patch + lozenges
- Combination bupropion + NRT (e.g., nicotine patch)
- NRT monotherapy
- Varenicline

- Number and details of counseling sessions
  - Face-to-face
  - Telephone
  - Duration and frequency
  - Provider who delivered the intervention

To track the effectiveness of your facility in providing tobacco cessation assistance, below is a checklist of performance measures you may want to track yearly, quarterly, monthly, weekly, and/or daily.

- Number of tobacco users screened for their interest in a tobacco cessation program
- Number of tobacco users ready for a screening visit with a tobacco cessation counselor following this visit
- Number of tobacco cessation medication prescriptions ordered by providers
- Number of patients prescribed specific medication regimens and their outcomes (i.e., abstinent at 1 month, 3 months, 6 months, 12 months)
- Number of counseling sessions, frequency, duration, provider who delivered interventions
